Taxonomy Of Angiosperms:

Taxonomy of Angiosperms Pandey B.P., 2001 Taxonomy of Angiosperms for University students **Introduction to Taxonomy of Angiosperms** Verma, Verma B. K., 2010-10 Taxonomy is one of the oldest biological disciplines. This book presents an account of general principles and aims of taxonomy in a comprehensive manner. It has been written mainly to cater the needs of undergraduate students pursuing courses in Botany Life Sciences Plant Sciences but it will be useful for postgraduate students of these disciplines as well. The book gives a critical account of the important systems of classification and salient features of the APG II Angiosperm Phylogeny Group 2003 system of plant taxonomy. It mentions the important rules of plant nomenclature and various codes of nomenclature including the latest Vienna Code of 2006. Further it discusses the usefulness of anatomy, embryology, palynology, chemistry, cytology and ecology under current trends in plant taxonomy. A thorough coverage of profusely illustrated 50 important dicotyledonous and monocotyledonous angiospermic families is the hallmark of this book. Each family is described covering the following points: Distribution, vegetative features, floral description, morphological nature of organs, further classification, affinities with other families, economic importance and description of common plants. Finally, the book covers the different aspects and theories related to the origin of angiosperms and elucidates the methods and techniques of herbarium development and maintenance. **KEY FEATURES** Presents a key to families described in the book. Provides a pro forma for the description of angiosperms. Includes a glossary of important technical terms. Lists the important Herbaria of India and the world. **Taxonomy of Angiosperms** A. V. S. S. Sambamurty, 2013-12-30 Taxonomy of Angiosperms is designed for B Sc H and M Sc students of Botany in various universities. The book is divided into two parts. Part I deals with the Principles of Angiosperm Taxonomy and Part II deals with families. The book is amply illustrated with examples. Some of the important chapters in Part I comprise: Different Classifications, Nomenclature, Biosystematics, Modern Trends in Taxonomy, Chemotaxonomy, Numerical Taxonomy etc. Part II deals with about 214 families of which 55 are discussed in detail and summarized accounts of the rest are given for advanced students. The book also comes loaded with numerous appendices like comparison of classifications, floral diagrams and floral formulae, questions etc. The book will cater to the needs of Botany students pursuing B Sc H M Sc and related fields like Medical Botany, Pharmacy, Agricultural Botany and Horticulture. Plant taxonomists seek to learn as much as they can about the earth's plant knowledge and gather them into systematic plants. Due to the vastness of Earth's vegetation knowledge cannot be gathered without first being organised. To begin we must take an exhaustive tally of all plant life in a given region and eventually the whole planet. The initial step in taxonomy is the gathering and preparation of herbarium specimens for future research. Identification is the next step and it requires identification descriptions, drawing pictures and creating keys. Taxonomy's main aim is to accurately identify all plant plants and its secondary goal is to order them according to a universally agreed categorization system. The process of identification entails deciding whether or not a taxon plural taxa is the same as or closely related to a previously known taxon. A plant may only be properly identified if it is placed in the correct taxonomic family and only then can it be properly classified as a species. This may be done with the aid of Floras monographs and herbaria all of which are now in circulation. A plant is considered to be a new species when all attempts to identify it as a member of an existing species have been fruitless. Assembling plants into taxonomic groups based on their shared characteristics is known as classification. The result is a well thought out classification system in which any number of species may be placed in any given category. Strongly linked groups are grouped together in accordance with the principles underlying any current system of classification which are based on their genetic link. *An Introduction to Taxonomy of Angiosperms* Priti Shukla, Shital P.. Practical Taxonomy Of Angiosperms R. K. Sinha,2010-07-01. Practical Taxonomy of Angiosperms presents the subject in a systematic manner with well labelled diagrams and flow charts. A sincere effort has been made to make this book more informative and useful by covering all the important aspects of the subject. Spread in five chapters it deals with Morphology of angiosperms where terminology used in taxonomic description of plants is arranged alphabetically under subheads stem leaves flowers etc. Taxonomy of angiosperms Principles of taxonomy handling of an artificial key to a flora and diagnostic features of common angiospermic families. Description systematization and identification of 84 plants of 44 families of angiosperms. Brief account of 143 plants of different families. Comparison of allied common angiospermic families in tabular form. Economic importance of 106 familiar plants. Differences between allied terminology e.g. phyllode phylloclade silqua siliqula are presented in tabular form. Artificial key to the common families of angiosperms.
