Campanella,2014-03-31 Extrusion is the operation of forming and shaping a molten or dough like material by forcing it through a restriction or die It

is applied and used in many batch and continuous processes. However, extrusion processing technology relies more on continuous process operations which use screw extruders to handle many process functions such as the transport and compression of particulate components, melting of polymers, mixing of viscous media, heat processing of polymeric and biopolymeric materials, product texturization and shaping, defibering and chemical impregnation of fibrous materials, reactive extrusion and fractionation of solid liquid systems. Extrusion processing technology is highly complex and in depth descriptions and discussions are required in order to provide a complete understanding and analysis of this area. This book aims to provide readers with these analyses and discussions. *Extrusion Processing Technology: Food and Non Food Biomaterials* provides an overview of extrusion processing technology and its established and emerging industrial applications. Potency of process intensification and sustainable processing is also discussed and illustrated. The book aims to span the gap between the principles of extrusion science and the practical knowledge of operational engineers and technicians. The authors bring their research and industrial experience in extrusion processing technology to provide a comprehensive technical yet readable volume that will appeal to readers from both academic and practical backgrounds. This book is primarily aimed at scientists and engineers engaged in industry research and teaching activities related to the extrusion processing of foods, especially cereals, snacks, textured and fibrated proteins, functional ingredients and instant powders, feeds, especially aquafeeds and petfoods, bioplastics and plastics, biosourced chemicals, paper pulp and biofuels. It will also be of interest to students of food science, food engineering and chemical engineering. It is supported with tables of separation distances, rules of thumb and codes of practice and standards. The book includes more than seventy-five case studies on what can go wrong when layout is not properly considered. Sean Moran has thoroughly rewritten and re-illustrated this book to reflect advances in technology and best practices, for example, changes in how designers balance layout density with cost, operability and safety considerations. The content covers the why underlying process design company guidelines, providing a firm foundation for career growth for process design engineers. It is ideal for process plant designers in contracting consultancy and for operating companies at all stages of their careers and is also of importance for operations and maintenance staff involved with a new build, guiding them through plot plan reviews. Based on interviews with over 200 professional process plant designers, it explains multiple plant layout methodologies used by professional process engineers, piping engineers and process architects. Includes advice on how to choose and use the latest CAD tools for plant layout. Ensures that all methodologies

integrate to comply with worldwide risk management legislation
