Solution Of Crack Problems The Distributed Dislocation Technique:

Solution of Crack Problems D.A. Hills,P.A. Kelly,D.N. Dai,A.M. Korsunsky,1996-02-29 This book is concerned with the numerical solution of crack problems The techniques to be developed are particularly appropriate when cracks are relatively short and are growing in the neighbourhood of some stress raising feature causing a relatively steep stress gradient It is therefore practicable to represent the geometry in an idealised way so that a precise solution may be obtained This contrasts with say the finite element method in which the geometry is modelled exactly but the subsequent solution is approximate and computationally more taxing The family of techniques presented in this book based loosely on the pioneering work of Eshelby in the late 1950 s and developed by Erdogan Keer Mura and many others cited in the text present an attractive alternative The basic idea is to use the superposition of the stress field present in the unflawed body together with an unknown distribution of strain nuclei in this book the strain nucleus employed is the dislocation chosen so that the crack faces become traction free The solution used for the stress field for the nucleus is chosen so that other boundary conditions are satisfied The technique is therefore efficient and may be used to model the evolution of a developing crack in two or three dimensions Solution techniques are described in some detail and the book should be readily accessible to most engineers whilst preserving the rigour demanded by the researcher who wishes to develop the method itself **Solution of Crack**

Vestroni,2006-06-22 The interest of the applied mechanics community in chaotic dynamics of engineering systems has exploded in the last fifteen years although research activity on nonlinear dynamical problems in mechanics started well before the end of the Eighties It developed first

within the general context of the classical theory of nonlinear oscillations or nonlinear vibrations and of the relevant engineering applications This was an extremely fertile field in terms of formulation of mechanical and mathematical models of development of powerful analytical techniques and of understanding of a number of basic nonlinear phenomena At about the same time meaningful theoretical results highlighting new solution methods and new or complex phenomena in the dynamics of deterministic systems were obtained within dynamical systems theory by means of sophisticated geometrical and computational techniques In recent years careful experimental studies have been made to establish the actual occurrence and observability of the predicted dynamic phenomena as it is vitally needed in all engineering fields Complex dynamics have been shown to characterize the behaviour of a great number of nonlinear mechanical systems ranging from aerospace engineering applications to naval applications mechanical engineering structural engineering robotics and biomechanics and other areas The International Union of Theoretical and Applied Mechanics grasped the importance of such complex phenomena in the Eighties when the first IUTAM Symposium devoted to the general topic of nonlinear and chaotic dynamics in applied mechanics and engineering was held in Stuttgart 1989

Symbolic Modeling of Multibody Systems J-C. Samin, P. Fisette, 2013-06-29 Modeling and analysing multibody systems require a comprehensive understanding of the kinematics and dynamics of rigid bodies In this volume the relevant fundamental principles are first reviewed in detail and illustrated in conformity with the multibody formalisms that follow Whatever the kind of system tree like structures closed loop mechanisms systems containing flexible beams or involving tire ground contact wheel rail contact etc these multibody formalisms have a common feature in the proposed approach viz the symbolic generation of most of the ingredients needed to set up the model The symbolic approach chosen specially dedicated to multibody systems affords various advantages it leads to a simplification of the theoretical formulation of models a considerable reduction in the size of generated equations and hence in resulting computing time and also enhanced portability of the multibody models towards other specific environments Moreover the generation of multibody models as symbolic toolboxes proves to be an excellent pedagogical medium in teaching mechanics

IUTAM Symposium on Physicochemical and Electromechanical Interactions in Porous Media Jacques Huyghe, Peter A.C. Raats, Stephen C. Cowin, 2006-01-28 In the last decades new experimental and numerical techniques have taken many advanced features of porous media mechanics down to practical engineering applications This happened in areas that sometimes were not even suspected to be open to engineering ideas at all The challenge that often

faces engineers in the field of geomechanics biomechanics rheology and materials science is the translation of ideas existing in one field to solutions in the other The purpose of the IUTAM symposium from which this proceedings volume has been compiled was to dive deep into the mechanics of those porous media that involve mechanics and chemistry mechanics and electromagnetism mechanics and thermal fluctuations of mechanics and biology The different sections have purposely not been formed according to field interest but on the basis of the physics involved

Applied High-Speed Plate Penetration Dynamics Gabi Ben-Dor, Anatoly Dubinsky, Tov Elperin, 2006-02-22 High speed impact dynamics is of interest in the fundamental sciences e.g. astrophysics and space sciences and has a number of important applications in military technologies homeland security and engineering When compared with experiments or numerical simulations analytical approaches in impact mechanics only seldom yield useful results However when successful analytical approaches allow us to determine general laws that are not only important in themselves but also serve as benchmarks for subsequent numerical simulations and experiments The main goal of this monograph is to demonstrate the potential and effectiveness of analytical methods in applied high speed penetration mechanics for two classes of problem The first class of problem is shape optimization of impactors penetrating into ductile concrete and some composite media The second class of problem comprises investigation of ballistic properties and optimization of multi-layered shields including spaced and two-component ceramic shields Despite the massive use of mathematical techniques the obtained results have a clear engineering meaning and are presented in an easy to use form One of the chapters is devoted solely to some common approximate models and this is the first time that a comprehensive description of the localized impactor-medium interaction approach is given In the monograph the authors present systematically their theoretical results in the field of high speed impact dynamics obtained during the last decade which only partially appeared in scientific journals and conferences proceedings

Mechanics of Curved Composites S.D. Akbarov, A.N. Guz, 2012-12-06 This book is the first to focus on mechanical aspects of fibrous and layered composite material with curved structure By mechanical aspects we mean statics vibration stability loss elastic and fracture problems By curved structures we mean that the reinforcing layers or fibres are not straight they have some initial curvature bending or distortion This curvature may occur as a result of design or as a consequence of some technological process During the last two decades we and our students have investigated problems relating to curved composites intensively These investigations have allowed us to study stresses and strains in regions of a composite which are small compared to the curvature wavelength These new accurate techniques were developed in the framework of continuum theories for piecewise homogeneous bodies We use the exact equations of elasticity or viscoelasticity for anisotropic bodies and consider linear and non linear problems in the framework of this continuum theory as well as in the framework of the piecewise homogeneous model For the latter the method of solution of related problems is proposed We have focussed our attention on self balanced stresses which arise from the curvature but have provided sufficient information for the study of other effects We assume that the reader is familiar with the theory of elasticity for anisotropic bodies with partial differential equations and integral transformations and also with the Finite Element Method

Direct Methods for Solving the

Boltzmann Equation and Study of Nonequilibrium Flows V.V. Aristov, 2012-12-06 This book is concerned with the methods of solving the nonlinear Boltzmann equation and of investigating its possibilities for describing some aerodynamic and physical problems This monograph is a sequel to the book Numerical direct solutions of the kinetic Boltzmann equation in Russian which was written with F G Tcheremissine and published by the Computing Center of the Russian Academy of Sciences some years ago The main purposes of these two books are almost similar namely the study of nonequilibrium gas flows on the basis of direct integration of the kinetic equations Nevertheless there are some new aspects in the way this topic is treated in the present monograph In particular attention is paid to the advantages of the Boltzmann equation as a tool for considering nonequilibrium nonlinear processes New fields of application of the Boltzmann equation are also described Solutions of some problems are obtained with higher accuracy Numerical procedures such as parallel computing are investigated for the first time The structure and the contents of the present book have some common features with the monograph mentioned above although there are new issues concerning the mathematical apparatus developed so that the Boltzmann equation can be applied for new physical problems Because of this some chapters have been rewritten and checked again and some new chapters have been added
