Software Synthesis from Dataflow Graphs addresses the problem of generating efficient software implementations from applications specified as synchronous dataflow graphs for programmable digital signal processors DSPs used in embedded real time systems The advent of high speed graphics workstations has made feasible the use of graphical block diagram programming environments by designers of signal processing systems A particular subset of dataflow called Synchronous Dataflow SDF has proven efficient for representing a wide class of unirate and multirate signal processing algorithms and has been used as the basis for numerous DSP block diagram based programming environments such as the Signal Processing Workstation from Cadence Design Systems Inc COSSAP from Synopsys both commercial tools and the Ptolemy environment from the University of California at Berkeley A key property of the SDF model is that static schedules can be determined at compile time This removes the overhead of dynamic scheduling and is thus useful for real time DSP programs where throughput requirements are often severe Another constraint that programmable DSPs for embedded systems have is the limited amount of on chip memory Off chip memory is not only expensive but is also slower and increases the power consumption of the system hence it is imperative that programs fit in the on chip memory whenever possible Software Synthesis from Dataflow Graphs reviews the state of the art in constructing static memory optimal schedules for programs expressed as SDF graphs Code size reduction is obtained by the careful organization of loops in the target code Data buffering is optimized by constructing the loop hierarchy in provably optimal ways for many classes of SDF graphs The central result is a uniprocessor scheduling framework that provably synthesizes the most compact looping structures called single appearance schedules for a certain class of SDF graphs In addition algorithms and heuristics are presented that generate single appearance schedules optimized for data buffering usage Numerous practical examples and extensive experimental data are provided to illustrate the efficacy of these techniques

Component-Based Software Development for Embedded Systems Colin Atkinson, Christian Bunse, Hans-Gerhard Gross, Christian Peper, 2005-11-19 Embedded systems are ubiquitous They appear in cell phones microwave ovens refrigerators consumer electronics cars and jets Some of these embedded systems are safety or security critical such as in medical equipment nuclear plants and X by wire control systems in naval

ground and aerospace transportation vehicles With the continuing shift from hardware to software embedded systems are increasingly dominated by embedded software Embedded software is complex Its engineering inherently involves a multidisciplinary interplay with the physics of the embedding system or environment Embedded software also comes in ever larger quantity and diversity The next generation of premium automobiles will carry around one gigabyte of binary code The proposed US DDX submarine is effectively a floating embedded software system comprising 30 billion lines of code written in over 100 programming languages Embedded software is expensive Cost estimates are quoted at around US 15 30 per line from commencement to shipping In the defense realm costs can range up to 100 while for highly critical applications such as the Space Shuttle the cost per line approximates 1 000 In view of the exponential increase in complexity the projected costs of future embedded software are staggering

Specification and Design Methodology for Real-Time Embedded Systems Randall S. Janka, 2012-12-06 Specification and design methodology has seen significant growth as a research area over the last decade tracking but lagging behind VLSI design technology in general and the CAD industry in particular The commercial rush to market tries to leverage existing technology which fuels CAD design tool development Paralleling this is very active basic and applied research to investigate and move forward rational and effective methodologies for accomplishing digital design especially in the field of hardware software codesign It is this close relationship between industry and academia that makes close cooperation between researchers and practitioners so important and monographs like this that combine both abstract concept and pragmatic implementation deftly bridge this often gaping chasm It was at the IEEE ACM Eighth International Symposium on Hardware Software Codesign where I met the author of this monograph Dr Randall Janka who was presenting some of his recent dissertation research results on specification and design methodology or as he has so succinctly defined this sometimes ambiguous concept the tools and rules Where so many codesign researchers are trying to prove out different aspects of codesign and using toy applications to do so Dr Janka had developed a complete specification and design methodology and prototyped the infrastructure and proven its viability utility and effectiveness using a demanding real world application of a real time synthetic aperture radar imaging processor that was implemented with embedded parallel processors

Multiprocessor Systems-on-Chips Ahmed Jerraya, Wayne Wolf, 2005 Modern system on chip SoC design shows a clear trend toward integration of multiple processor cores on a single chip Designing a multiprocessor system on chip MPSOC requires an understanding of the various design styles and techniques used in the multiprocessor Understanding the application area of the MPSOC is also critical to making proper tradeoffs and design decisions Multiprocessor Systems on Chips covers both design techniques and applications for MPSOCs Design topics include multiprocessor architectures processors operating systems compilers methodologies and

synthesis algorithms and application areas covered include telecommunications and multimedia The majority of the chapters were collected from presentations made at the International Workshop on Application Specific Multi Processor SoC held over the past two years The workshop assembled internationally recognized speakers on the range of topics relevant to MPSOCs After having refined their material at the workshop the speakers are now writing chapters and the editors are fashioning them into a unified book by making connections between chapters and developing common terminology Examines several different architectures and the constraints imposed on them Discusses scheduling real time operating systems and compilers Analyzes design trade off and decisions in telecommunications and multimedia applications
