Baveye, 2020-03-30 Soil fauna plays a significant role at all trophic levels of the soil food web and regulates processes that are crucial for soil functioning such as nutrient cycling immobilization and or degradation of toxic compounds formation of soil structure greenhouse gas emissions and C turnover Although soil fauna is not thought to contribute significantly to soil respiration during litter or soil organic matter SOM decomposition the diversity of soil fauna has been found to strongly influence SOM distribution and dynamics Yet the functional contribution of soil fauna to many soil processes is not well understood due to methodological limitations and the high complexity of interactions at various spatiotemporal scales In general soil fauna has received far less scientific attention than bacteria and fungi and lately archaea in soil studies and has been regularly ignored in global biogeochemical models with maybe exceptions for some earthworms However recent studies are raising the awareness of the influence of soil fauna on ecosystems dynamics For instance earthworms have been found to be major players in N₂O emissions from soils They exert a strong influence on C stabilization and they promote the degradation of polycyclic aromatic hydrocarbons PAHs Less studied ants and termites have been found to increase crop productivity in drylands and different lifeforms of Collembola have been shown to impact microorganisms in various ways over time thereby potentially affecting C and N cycles within farming systems The influence of soil fauna indeed manifests over a broad ranges of spatiotemporal scales For example some effect such as aggregate formation may cumulate over time and finally contribute to the formation of whole soil profiles which serve as a framework for other soil processes such as water movement decomposition etc Meanwhile soil biodiversity is impacted by an increasing human pressure through deforestation agriculture intensification habitat fragmentation or climate change increasing temperatures extreme weather events which leads to soil biodiversity loss in particular of soil fauna with associated consequences on soil functioning and resilience **Animal Ecology** Arthur Sperry Pearce, 1926 **Soils and Environmental Quality** Gary M. Pierzynski, George F. Vance, J. Thomas Sims, 2005-05-02 A perpetual bestseller this third edition explores environmental quality from the perspective of soil science The coverage ranges from the theoretical to the practical with an abundance of examples such as an exploration of allowable pesticide concentrations in drinking water and an inquiry into soil contamination from the trace elements in organic by products It also explores the use of soil carbon sequestration as a remedy for global climate change and the effects of acid precipitation on forestation Case studies with political economic and legal implications illustrate the human side of environmental problems Also covered is the use or misuse of the Scientific Method and the potential for factual bias The three authors all teaching professors distinguished in soil science have updated this student favorite to include a greater number of even more relevant topics Responding to request [Encyclopedia of Soil Science](#) Ward Chesworth, 2007-11-22 The Encyclopedia of Soil Science
