Handbook of Bayesian Variable Selection Mahlet G. Tadesse, Marina Vannucci, 2021-12-24 Bayesian variable selection has experienced substantial developments over the past 30 years with the proliferation of large data sets Identifying relevant variables to include in a model allows simpler interpretation avoids overfitting and multicollinearity and can provide insights into the mechanisms underlying an observed phenomenon Variable selection is especially important when the number of potential predictors is substantially larger than the sample size and sparsity can reasonably be assumed The Handbook of Bayesian Variable Selection provides a comprehensive review of theoretical methodological and computational aspects of Bayesian methods for variable selection The topics covered include spike and slab priors continuous shrinkage priors Bayes factors Bayesian model averaging partitioning methods as well as variable selection in decision trees and edge selection in graphical models The handbook targets graduate students and established researchers who seek to understand the latest developments in the field It also provides a valuable reference for all interested in applying existing methods and or pursuing methodological extensions Features Provides a comprehensive review of methods and applications of Bayesian variable selection Divided into four parts Spike and Slab Priors Continuous Shrinkage Priors Extensions to various Modeling Other Approaches to Bayesian Variable Selection Covers theoretical and methodological aspects as well as worked out examples with R code provided in the online supplement Includes contributions by experts in the field Supported by a website with code data and other supplementary material

MRI of Short- and Ultrashort-T2 Tissues Jiang Du, Graeme M. Bydder, 2024-02-21 This book comprehensively covers ultrashort echo time UTE zero echo time ZTE and other magnetic resonance imaging MRI acquisition techniques for imaging of short and ultrashort T2 tissues MRI uses a large magnet and radio waves to generate

images of tissues in the body The MRI signal is characterized by two time constants spin lattice relaxation time T_1 which describes how fast the longitudinal magnetization recovers to its initial value after tipping to the transverse plane and spin spin relaxation time T_2 which describes how fast the transverse magnetization decays Conventional MRI techniques have been developed to image and quantify tissues with relatively long T_2 s However the body also contains many tissues and tissue components such as cortical bone menisci ligaments tendons the osteochondral junction calcified tissues lung parenchyma iron containing tissues and myelin which have short or ultrashort T_2 s These tissues are invisible with conventional MRI and their MR and tissue properties are not measurable UTE and ZTE type sequences resolve these challenges and make these tissues visible and quantifiable This book first introduces the basic physics of conventional MRI as well as UTE and ZTE type MRI including radiofrequency excitation data acquisition and image reconstruction A series of contrast mechanisms are then introduced and these provide high resolution high contrast imaging of short and ultrashort T_2 tissues A series of quantitative UTE imaging techniques are described for measurement of MR tissue properties proton density T_1 T_2 T_2^* $T_1\rho$ magnetization transfer susceptibility perfusion and diffusion Finally clinical applications in the musculoskeletal neurological pulmonary and cardiovascular systems are described This is an ideal guide for physicists and radiologists interested in learning more about the use of UTE and ZTE type techniques for MRI of short and ultrashort T_2 tissues
