creating waking experiences that resemble the human dream Surprisingly AI systems also easily meet all human based operational criteria for dreaming These dreams are far different from anthropomorphic dreaming including such processes as fuzzy logic liquid illogic and integration instability all processes that may be necessary in both biologic and artificial systems to extend creative capacity Today multi linear AI systems are being built to resemble the structural framework of the human central nervous system The creation of the biologic framework of dreaming emotions associative memories and visual imagery is well within our technical capacity AI dreams potentially portend the further development of consciousness in these systems This focus on AI dreaming raises even larger questions In many ways dreaming defines our humanity What is humanly special about the states of dreaming And what are we losing when we limit our focus to its technical and biologic structure and extend the capacity for dreaming into our artificial creations Machine Dreaming and Consciousness provides thorough discussion of these issues for neuroscientists and other researchers investigating consciousness and cognition Addresses the function and role of dream like processing in AI systems Describes the functions of dreaming in the creative process of both humans and machines Presents an alternative approach to the philosophy of machine consciousness Provides thorough discussion of machine dreaming and consciousness for neuroscientists and other researchers investigating consciousness and cognition

The Boundaries of Consciousness: Neurobiology and Neuropathology Steven

Laureys, 2006-08-24 Consciousness is one of the most significant scientific problems today. Renewed interest in the nature of consciousness, a phenomenon long considered not to be scientifically explorable, as well as increasingly widespread availability of multimodal functional brain imaging techniques (EEG, ERP, MEG, fMRI, and PET) now offer the possibility of detailed integrated exploration of the neural, behavioral, and computational correlates of consciousness. The present volume aims to confront the latest theoretical insights in the scientific study of human consciousness with the most recent behavioral, neuroimaging, electrophysiological, pharmacological, and neuropathological data on brain function in altered states of consciousness, such as brain death, coma, vegetative state, minimally conscious state, locked-in syndrome, dementia, epilepsy, schizophrenia, hysteria, general anesthesia, sleep, hypnosis, and hallucinations. The interest of this is threefold. First, patients with altered states of consciousness continue to represent a major clinical problem in terms of clinical assessment of consciousness and daily management. Second, the exploration of brain function in altered states of consciousness represents a unique lesional approach to the scientific study of consciousness and adds to the worldwide effort to identify the neural correlate of consciousness. Third, new scientific insights in this field have major ethical and social implications regarding our care for these patients.
