Neuroendocrine-immune Interactions Rolf C. Gaillard,2002 Interactions between the immune endocrine and nervous systems seldom appear as main issues in the neurosciences and in immunology So far this was most likely due to the need to focus on the molecular and cellular bases of single neural endocrine and immune processes But hormones neurotransmitters and neuropeptides can also influence more subtle mechanisms underlying immune cell activity The contents of this volume aim at listing some aspects which show that not only the bases for neuroendocrine control of more refined mechanisms related to the organization and functioning of the immune systems to exist but also that the immune system can actively communicate with neuroendocrine structures The evidence is divided into three categories Anatomical cellular and molecular bases for the exchange of information between immune endocrine and neural cells reciprocal effects between immune and neuroendocrine mechanisms and immune neuroendocrine regulatory circuits Immunologically triggered neuroendocrine responses can be either beneficial or deleterious for the host A systematic approach would imply the simultaneous evaluation of neuroendocrine and immune parameters and thus provide the basis for therapeutic interventions based on antagonizing or blocking undesirable effects *Society for Neuroscience Abstracts* Society for Neuroscience. Society for Neuroscience Abstracts Society for Neuroscience (U.S.). Annual Meeting,1999 **Soft Robotics** Alexander Verl,Alin Albu-Schäffer,Oliver Brock,Annika Raatz,2015-03-13 The research areas as well as the knowledge gained for the practical use of robots are growing and expanding beyond manufacturing and industrial automation making inroads in sectors such as health care and terrain sensing as well as general assistive systems working in close interaction with humans In a situation like this it is necessary for future robot systems to become less stiff and more specialized by taking inspiration from the mechanical compliance and versatility found in natural materials and organisms At present a new discipline is emerging in this area called Soft Robotics It particularly challenges the traditional thinking of engineers as the confluence of

technologies ranging from new materials sensors actuators and production techniques to new design tools will make it possible to create new systems whose structures are almost completely made of soft materials which bring about entirely new functions and behaviors similar in many ways to natural systems These Proceedings focus on four main topics Soft Actuators and Control Soft Interactions Soft Robot Assistants Potential and Challenges Human centered Soft Robotics
