

# Sound Travels!

**Today's mission:** To investigate how sound travels and test how a string telephone works best

## What you need:

## Let's get started!

Make a 'string telephone' by attaching each end of a long piece of string to the bottoms of your two cups - using Sellotape or by making a hole (△ Adult needed), threading string through it and tying a big knot. Hold a cup to your ear as someone talks into the other.

Can you hear each other?

What could improve this?

Sound travels because tiny particles of matter pass on vibrations to neighbouring particles, like a domino 'race' where the dominoes could spring back up again.

Try tapping your finger on a table and comparing the sound when sitting normally to having your ear pressed to the table.

Does sound travel better through a solid (table) or a gas (air)?

Which do you think has the stronger connections between its particles – a solid or a gas?

If there are no air particles in outer space, can sound travel through it?

How do astronauts communicate during space walks?

How well does sound travel through liquids?

What can you hear with your ears under water in a bath?
