Tensile Fracturing In Rocks:

Tensile Fracturing in Rocks Dov Bahat, Avinoam Rabinovitch, Vladimir Frid, 2004-10-05 *Tensile Fracturing in Rocks* presents field observations on fracturing of sedimentary rocks and granite outcrops from various provinces in three continents. It also combines results of recent experiments conducted at different laboratories around the world with current theories on fracturing. In treating faults, this book limits itself to faults that are associated with joint sets produced by definable causes and occasionally to cases where interaction between the two types of fracture faults and joints is not clear. The book's subject matter is divided over six chapters which are briefly described below. Chapter 1 summarizes current key concepts in fracture physics. It starts with a presentation of the elastic theory of fracture and concentrates on the results of linear elastic fracture mechanics. The chapter touches also upon other fracture properties e.g. crack nucleation, dynamic fracturing and slow fracturing processes. Nucleation is addressed by statistical mechanics methods incorporating modern approaches of thermal and fiber bundle processes. The analyses of dynamic fracturing and slow fracturing focus on the differences as compared to the linear elastic approach. The controversy in interpreting experimental dynamic results is highlighted as are the surface morphology patterns that emerge in fracturing and the non-Griffith crack extension criterion in very slow fracturing processes.

Flow and Fracture of Rocks Hugh Corey Heard, 1972. Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 16. The Griggs Volume. David Tressel Griggs was born October 6, 1911 in Columbus, Ohio. His parents were Robert Fiske and Laura Amelia Tressel Griggs. His father was a widely known professor of botany and a leading ecologist and environmental conservationist at a time when these viewpoints were less familiar than they are today. David was an undergraduate at Ohio State University in 1930 when he participated in a National Geographic Society expedition led by his father to the Valley of Ten Thousand Smokes. This Alaskan experience and the encouragement he received from a gifted and enthusiastic teacher, Professor Edmund M. Spieker, led him to choose for his life work the application of physics to the problems of the earth. After a year of graduate studies in geology at Ohio State, David moved on in 1933 to Harvard where a new program of high pressure studies devoted to geophysical problems had just been initiated under the inspired guidance of Percy W. Bridgman, pre-eminent leader in the experimental exploration of the physics of very high pressures and in the philosophical analysis of the logical processes of scientific thinking.
