Steepland Geomorphology:

Steepland Geomorphology Olav Slaymaker, 1995-12-04 Steepland geomorphology concerns high gradient landscapes which are either tectonically active or influenced by volcanism and where there is a perceived close relationship between soils incomplete vegetation cover recent geomorphic processes and associated landforms Such areas are difficult to manage because of their high variability in terms of natural stability and because of inadequate theory and models This book through thirteen independent steepland field investigations illustrates the differing conceptual frameworks that are used at four different temporal scales of investigation The first four investigations from Southern Africa the Yukon Territory the German Alps and Colombia define relevant temporal scales The other investigations concern the sediment production problem in Spitzbergen and northern Norway sediment storage phenomena in Iceland Bolivia the Himalayas and the Apennines and methods of interpreting environmental change from Japan the Canadian Rockies Ecuador and Bolivia **MOUNTAIN**

GEOMORPHOLOGY Phil Owens, Olav Slaymaker, 2014-02-04 Mountains represent one of the most inspiring and attractive natural features on the surface of the earth Visually they dominate the landscape However the increasing realization of the fragility of mountain areas because of changes in land use management and climate combined with an understanding of their importance for water and other natural resources has resulted in a growing interest in mountain environments in recent years Hence Mountain Geomorphology represents a timely and unique contribution to the literature Written by a team of international experts this book is divided into three sections which consider historical functional and applied mountain geomorphology from both global and local perspectives Historical mountain geomorphology focuses on the evolution of landforms Functional mountain geomorphology emphasises the interaction between processes and landforms while applied mountain geomorphology concerns the interrelationships between geomorphological processes and society Mountain Geomorphology is a valuable source of information for students studying mountain geomorphology and also for academics and research scientists interested in mountain environments *Treatise on Geomorphology*, 2013-02-27 The changing focus and approach of geomorphic research suggests that the time is opportune for a summary of the state of discipline The number of peer reviewed papers published in geomorphic journals has grown steadily for more than two decades and more importantly the diversity of authors with respect to geographic location and disciplinary background geography geology ecology civil engineering computer science geographic information science and others has expanded dramatically As more good minds are drawn to geomorphology and the breadth of the peer reviewed literature grows an effective summary of contemporary geomorphic knowledge becomes increasingly difficult The fourteen volumes of this *Treatise on Geomorphology* will provide an important reference for users from undergraduate students looking for term paper topics to graduate students starting a literature review for their thesis work and professionals seeking a concise summary of a particular topic Information on the historical development of diverse topics within geomorphology provides context for ongoing research

discussion of research strategies equipment and field methods laboratory experiments and numerical simulations reflect the multiple approaches to understanding Earth's surfaces and summaries of outstanding research questions highlight future challenges and suggest productive new avenues for research Our future ability to adapt to geomorphic changes in the critical zone very much hinges upon how well landform scientists comprehend the dynamics of Earth's diverse surfaces This Treatise on Geomorphology provides a useful synthesis of the state of the discipline as well as highlighting productive research directions that Educators and students researchers will find useful Geomorphology has advanced greatly in the last 10 years to become a very interdisciplinary field Undergraduate students looking for term paper topics to graduate students starting a literature review for their thesis work and professionals seeking a concise summary of a particular topic will find the answers they need in this broad reference work which has been designed and written to accommodate their diverse backgrounds and levels of understanding Editor in Chief Prof J F Shroder of the University of Nebraska at Omaha is past president of the QG G section of the Geological Society of America and present Trustee of the GSA Foundation while being well respected in the geomorphology research community and having won numerous awards in the field A host of noted international geomorphologists have contributed state of the art chapters to the work Readers can be guaranteed that every chapter in this extensive work has been critically reviewed for consistency and accuracy by the World expert Volume Editors and by the Editor in Chief himself No other reference work exists in the area of Geomorphology that offers the breadth and depth of information contained in this 14 volume masterpiece From the foundations and history of geomorphology through to geomorphological innovations and computer modelling and the past and future states of landform science no stone has been left unturned

Geomorphology of Lake-Catchment Systems Kenji Kashiwaya, 2017-07-24 This book presents the study of limnogeomorphology in which past proxy data such as lacustrine sediments with information on landform development can be linked to modern observed data acquired by instruments including hydro geomorphological and sedimentary data Traditionally in the field of earth sciences it has been thought that geophysical studies dealing mainly with the present process were not smoothly linked to geological studies that originated from historical studies Although such earth surface process studies are closely related to those on historical landform development in the field of geomorphology they have been studied separately Those two geomorphology studies correspond to process geomorphology dynamic geomorphology and historical geomorphology There have been some attempts to combine them however they lacked past quantitative records available for further analyses In the study of limnogeomorphology proxy data can be converted to quantitative information to be utilized in future environmental discussions This book also covers information not only on large lake catchment systems but on small systems Those include long term and short term and large scale and small scale environmental changes in east Eurasia such as Lake Baikal Lake Khuvsgul Lake Biwa and small lakes in Japan Mongolia China and Korea

Geomorphological Hazards and Disaster Prevention Irasema Alcántara, Andrew S. Goudie, 2010-03-04 A state of the

art assessment of how geomorphology contributes to the comprehension mapping and modelling of hazardous Earth surface processes

Contemporary Meanings in Physical Geography Andre Roy, Stephen Trudgill, 2014-04-08 Over the past twenty years geography as an academic discipline has become more and more reflective asking the key questions What are we doing Why are we doing it These questions have so far been more enthusiastically taken up by human geography rather than physical geography *Contemporary Meanings in Physical Geography* aims to redress the balance Written and edited by a distinguished group of physical geographers *Contemporary Meanings in Physical Geography* comprises of a collection of international writer s thoughts which reveal personal motivations and look at tensions in the worlds of meaning in which physical geography is involved How are the meanings of the physical environment derived Is the future of physical geography one where the only or at least the dominant meanings are framed in the contexts of environmental issues Covering a diverse and lively selection of topics the contributors of this book offer guides to the contemporary debates in the philosophy of physical geography and introduce the reader to its wider cultural significance This book is an essential companion to anyone studying or with an interest in physical geography

Geomorphological Hazards and Disaster Prevention Irasema Alcántara-Ayala, Andrew S. Goudie, 2010-03-04 Human activities have had a huge impact on the environment and landscape through industrialisation and land use change leading to climate change deforestation desertification land degradation and air and water pollution These impacts are strongly linked to the occurrence of geomorphological hazards such as floods landslides snow avalanches soil erosion and others Geomorphological work includes not only the understanding but the mapping and modelling of Earth s surface processes many of which directly affect human societies In addition geomorphologists are becoming increasingly involved with the dimensions of societal problem solving through vulnerability analysis hazard and risk assessment and management The work of geomorphologists is therefore of prime importance for disaster prevention An international team of geomorphologists have contributed their expertise to this volume making this a scientifically rigorous work for a wide audience of geomorphologists and other Earth scientists including those involved in environmental science hazard and risk assessment management and policy

Ice-marginal and Periglacial Processes and Sediments Ireneo Peter Martini, Hugh M. French, Augusto Pérez Alberti, 2011 Understanding the sediments deposited by glaciers or other cold climate processes assumes enhanced significance in the context of current global warming and the predicted melt and retreat of glaciers and ice sheets This volume analyses glacial proglacial and periglacial settings Papers include topics such as sedimentation at termini of tidewater glaciers poorly understood high mountain features and slope and aeolian deposits that have been sourced in glacial and periglacial regions and subsequently transported and deposited by azonal processes Difficulties encountered in inferring Pleistocene and pre Pleistocene cold climate conditions when the sedimentary record lacks specific diagnostic indicators are discussed The main objective of this volume is to establish the validity and limitations of the evidence that is used to achieve reliable palaeogeographic and palaeoclimatic reconstructions

On the much longer geological timescale an understanding of ice marginal and periglacial environments may better prepare us for the unavoidable reversal towards cooler and perhaps even glacial times in the future **GLACIAL LANDSYSTEMS**

David Evans, 2014-02-04 This book is a comprehensive overview of the ever captivating field of glaciation from the perspective of glacial landsystems This approach models the many processes forms and interactions that can be found in glaciated landscapes throughout the world Landsystems models allow the glacial geologist and geomorphologist to evaluate these landscapes in relation to the dynamics of glaciation and to climate and geology Glacial Landsystems brings together the expertise of an international range of specialists to provide an up to date summary of landsystems relevant to both modern and ancient glacier systems and also in the reconstruction and interpretation of former glacial environments The models are applicable at all scales from ice sheets to small valley glaciers This book is an essential reference for anyone embarking upon research or engineering surveys in glaciated basins and provides a wide ranging handbook of glacial landsystem types for students of glaciation *Mountain Environments: Changes and Impacts* José M. García-Ruiz, José

Arnáez, Teodoro Lasanta, Estela Nadal-Romero, Juan Ignacio López- Moreno, 2024-04-26 This book studies mountains with a global perspective like a complex topographic and topoclimatic mosaic organized in altitudinal belts that are influenced by a huge variability in slopes soils lithology and insolation Furthermore the presence of lower temperatures higher precipitation and the seasonal presence of snow create conditions conducive to supporting various life forms and natural geomorphological and hydrological processes The integration of environmental and human aspects highlights the impacts of human activities and climate fluctuations on soil hydrology soil erosion water resources and landscape landforms evolution After presenting the way in which humans from Prehistory to Alexander von Humboldt discovered the mountains subsequent chapters try to underline the importance of mountains in generating water resources and hydropower for lowlands serving as biodiversity hotspots and contributing to cultural diversity The book delves into the role of human activities in transforming the natural landscapes and creating new cultural landscapes This exploration considers the significance of altitudinal belts in shaping the spatial and temporal organization of land uses which in turn have been determined by population growth and the development of regional and national markets Additionally the book illustrates the effect of global change on mountain evolution exploring their consequences on landscape characteristics and dynamics as well as on the planetary role of the mountains It concludes by offering a unique perspective on enhancing mountain conservation in order to preserve cultures land uses and landscapes
