Stanley Rabun, Richard Miles Kelso, 2009-01-09 This book is designed for architects and engineers who need to evaluate existing buildings for a new use or for continuing a current use It details each step of the evaluation process using an easy to follow and easy to implement approach that greatly reduces the possibility of unexpected costs and setbacks Moreover the book covers every part of the building itself from interior and exterior structures to systems and materials Illustrations throughout the book will help you visualize and perform key procedures In addition the authors examine building evaluation issues for structures of different scales such as medium and small commercial structures and residential buildings Most important the authors help you assess the financial viability of a proposed adaptive reuse or preservation project helping you and potential investors decide whether the proposed project offers a desired return on investment Jacket *Highways Handbook* Highway Education Board, 1929 **Design of Integrally-Attached Timber Plate Structures** Yves Weinand, 2021-09-26 Design of Integrally Attached Timber Plate Structures outlines a new design methodology for digitally fabricated spatial timber plate structures presented with examples from recent construction projects It proposes an innovative and sustainable design methodology algorithmic geometry processing structural optimization and digital fabrication technology transfer and construction are formulated and widely discussed The methodology relies on integral mechanical attachment whereby the connection between timber plates is established solely through geometric manipulation without additional connectors such as nails screws dowels adhesives or welding The transdisciplinary design framework for spatial timber plate structures brings together digital architecture computer science and structural engineering covering parametric modeling and architectural computational design geometry exploration the digital fabrication assembly of

engineered timber panels numerical simulations mechanical characterization design optimization and performance improvement The method is demonstrated through different prototypes physical models and three build examples focusing specifically on the design of the timber plate roof structure of 23 large span arches called the Annen Headquarters in Luxembourg This is useful for the architecture engineering and construction AEC sector and shows how new structural optimization processes can be reinvented through geometrical adaptations to control global and local geometries of complex structures This text is ideal for structural engineering professionals and architects in both industry and academia and construction companies
