Biomedical Index to PHS-supported Research ,1990 Frontiers in Clinical Drug Research – Dementia: Volume 2 José Juan Antonio Ibarra Arias,2021-11-09 Among neurodegenerative diseases those that lead to a state of dementia are the aim of several investigations Dementia is a chronic disease the prevalence of which is increasing worldwide The number of dementia patients in the world is approximately 50 million and it is estimated that the number of patients will reach 131 5 million by 2050 This increase will be accompanied by a significant increase in medical expenditures and other expenses especially for elderly patients Therefore the maintenance cost of dementia in the future is expected to be quite high For this reason several investigations aim firstly to describe the key mechanisms involved in the origin of dementia and secondly to establish preventive and therapeutic strategies in order to understand and mitigate this debilitating pathology This volume of Frontiers in Clinical Drug Research Dementia explores the current comorbidities that cause cognitive impairment and the current management alternatives for clinical cases of dementia The reviews contributed in these volume will provide readers with a current perspective on the subject The topics covered in this volume include Comorbidities inducing mild cognitive impairment an evaluation of the risk caused by some pathological conditions Tau targeted therapy in Alzheimer s disease history and current state Emerging nanotherapeutic strategies in Alzheimer s disease Implication of dehydroepiandrosterone on dementia related to oxidative stress Polyphenol compounds as potential therapeutic agents in Alzheimer s disease The volume is a timely update on dementia treatment for clinical physicians neurologists gerontologists pharmaceutical and medicinal chemistry researchers and physiologists **Protein Aggregation and Propagation in Neurodegenerative Diseases** Hui Yang,Jia-Yi Li,Jia Liu,2022-11-10 Preclinical and clinical issues in Alzheimer's disease drug research and development Cesare Mancuso,Silvana Gaetani,2015-03-03 Alzheimer s disease AD is a chronic neurodegenerative disorder characterized by progressive cognitive dysfunction and memory loss inability to perform the activities of daily living and mood disorders According to the so called amyloid cascade hypothesis amyloid peptide A produced by beta and gamma secretase mediated cleavages of the amyloid precursor protein APP plays a pivotal role in the pathogenesis of AD A was also shown to contribute to AD pathology by stimulating the hyperphosphorylation of tau which is responsible for the formation of neurofibrillary tangles However the amyloid cascade hypothesis was challenged by other theories which lend support to the idea that A is not causative but can be considered as an innocent bystander in AD Although preclinical research generated impressive lines of evidence about the several intracellular mechanism s whose impairment leads to the onset and progression of AD clinical research aimed at the development of new drugs capable of preventing or delaying the onset of neuronal damage in AD patients has produced limited results The drugs currently available for the treatment of AD are acetylcholinesterase inhibitors AChEI and the NMDA glutamate receptor antagonist memantine The AChEI increase

acetylcholine levels in the synaptic cleft which are reduced because of the progressive damage of cholinergic neurons in cognitive brain areas e g amygdala hippocampus and frontal cortex whereas memantine is used to prevent reduce calcium dependent excitotoxic neuronal cell death Both classes of drugs have been shown to improve symptoms related to cognitive decline but their effects are confined largely to patients with mild to moderate AD in particular during the first year or so of treatment An alternative to this symptomatic treatments involves the use of drugs that intervene in the pathogenesis of the disease Recently monoclonal antibodies against A were proposed as novel agents capable to remove A from the brain thus preventing neuronal damage The research topic focuses on the preclinical and clinical evidence about the several factors that contribute to the pathogenesis of AD as well as the potential therapeutic role of new classes of drugs still under preclinical or clinical development *Research Awards Index* ,1989 **Biomedical Index to PHS-supported Research: pt.
