

# Improving CAI Effectiveness with Attention to Instructional Design in Teaching Story Problems to Mildly Handicapped Students

MARY GLEASON, DOUGLAS CARNINE, DIANE BORIERO, University of Oregon

## Abstract

This report summarizes the results of a study in which a computer-assisted tutorial was compared to a teacher-assisted group in teaching multiplication and division math story problems to mildly handicapped middle school students. The same curriculum was used for both conditions; the only difference between the two instructional approaches was the medium used to communicate instruction to the students. Comparisons of scores from a pretest, two posttests, and one of two transfer tests demonstrated no significant differences between the groups; however, both groups showed a significant improvement from pretest to posttest scores. Comparisons are made with an earlier study in which neither group learned from the instruction. Results from the two studies indicate that, when sound instructional design principles are used to design CAI, the computer can be an effective instructional medium for mildly handicapped students, even for a complex skill such as math story problems.

In recent years, the number of microcomputers being used in special education classrooms has increased dramatically (Hanley, 1984; Mokros & Russell, 1986). As the number has increased, teachers and researchers have asked numerous questions regarding the use of computers in special education. Most research has documented how computers have been implemented in the schools, with less attention paid to the effects of CAI on learning, particularly for mildly handicapped students (Hanley, 1984). Although relatively little research has been conducted to answer this question, the use of microcomputers for instruction appears promising (Ellis & Sabornie, 1986). Numerous studies have concluded that CAI, when used as a supplement to teacher-directed instruction, is more effective in increasing student performance than when CAI is used alone (e.g., Burns & Bozeman, 1981; Chiang, 1978; Forman, 1982; Kulk, Bangert, & Williams, 1983; Lieber & Semmel, 1985).

Since 1982, the authors and their colleagues have investigated a broader range of issues surrounding technology and special education—differential effectiveness for various academic tasks,

for different stages of instruction, and for varying levels of involvement on the part of the teacher (Carnine, 1984; Woodward et al., 1986). Four recent studies, three of which achieved significant results, demonstrated that CAI could be effective as an instructional medium regardless of the type of CAI (drill and practice, tutorial, simulation), type of academic task (vocabulary, reasoning skills, problem solving), or degree of involvement of the teacher (from very little to providing instruction before students practiced with the simulation) (Woodward et al., 1986).

Although a large number of studies have been conducted in math problem solving, few have yielded information for building effective interventions in this area. The field is in need of a strategy that will work with low-achieving students, particularly those with learning disabilities. A previous study (Gleason, 1985) examined the effectiveness of a CAI tutorial program for teaching math story problems. The specific purpose of the study was to determine whether mildly handicapped students could learn to solve multiplication and division story problems if taught a strategy for choosing the cor-
