Federal Register, 2001-11 *Glass as a Waste Form and Vitrification Technology* National Research Council, Division on Earth and Life Studies, Commission on Geosciences, Environment and Resources, Steering Committee on Vitrification of Radioactive Wastes, 1997-03-02 *An End State Methodology for Identifying Technology Needs for Environmental Management, with an Example from the Hanford Site Tanks* National Research Council, Division on Earth and Life Studies, Commission on Geosciences, Environment and Resources, Committee on Technologies for Cleanup of High-Level Waste in Tanks in the DOE Weapons Complex, 1999-03-16

A major issue in the cleanup of this country's nuclear weapons complex is how to dispose of the radioactive waste resulting primarily from the chemical processing operations for the recovery of plutonium and other defense strategic nuclear materials. The wastes are stored in hundreds of large underground tanks at four U.S. Department of Energy (DOE) sites throughout the United States. The tanks contain hundreds of thousands of cubic meters of radioactive and hazardous waste. Most of it is high-level waste (HLW); some of it is transuranic (TRU) or low-level waste (LLW) and essentially all containing significant amounts of chemicals deemed hazardous. Of the 278 tanks involved, about 70 are known or assumed to have leaked some of their contents to the environment. The remediation of the tanks and their contents requires the development of new technologies to enable cleanup and minimize costs while meeting various health, safety, and environmental objectives. While DOE has a process based on stakeholder participation for screening and formulating technology needs, it lacks transparency in terms of being apparent to all concerned decision makers and other interested parties and a systematic basis in terms of identifying end states for the contaminants and developing pathways to these states from the present conditions. *An End State Methodology for Identifying Technology Needs for Environmental Management with an Example from the Hanford Site Tanks* describes an approach for identifying technology development needs that is both systematic and transparent to enhance the cleanup and remediation of the tank contents and their sites. The authoring committee believes that the recommended end-state-based approach can be applied to DOE waste management in general, not just to waste in tanks. The approach is illustrated through an example based on the tanks at the DOE Hanford Site in southeastern Washington state, the location of some 60 percent by volume of the tank waste residues.

Minimizing during Decommissioning *Generic EIS for Nuclear Power Plant Operating Licenses Renewal*, 1996 **Nuclear Power or a Promise Lost** Edward T. Burns, 2020-05-01 This book captures the status of current electrical energy markets including the principal forces affecting decisions on selecting an energy source. It represents a seminal work that lays out the electrical energy decision tree for selecting an energy source in a world that is on the verge of catastrophic global warming because of the choices that have been made in the name of cheap energy. The impetus for this book includes the dire need to mitigate continued anthropogenic causes of global warming by turning to carbon free energy sources. Nuclear energy represents such a carbon free energy source and could be a partial solution to the existential threat facing future society: the threat of a warming planet and its consequential catastrophic effects on future generations. The world is at a crossroads in human interaction with their environment. The effects of radiation and the relationship of nuclear power to nuclear weapons are both discussed in an understandable and compelling manner. Nuclear energy is contrasted with other energy sources including fossil fuels and renewable energy sources regarding the risks and benefits imposed by each. Important personalities and world events that shaped nuclear power's development are recounted. The historical origins of nuclear power are outlined and the continued impetus to include nuclear power as part of the electric grid energy mix is assessed, exposing the obstacles and road blocks to the continued use of nuclear power. Specific attention is paid to revealing the causes and lessons learned from the three severe accidents in commercial nuclear plants: TMI 2, Chernobyl, and Fukushima. An extensive discussion of nuclear waste disposal is provided as part of the decision tree for energy selection. The context for the future of nuclear power as a viable energy source is illuminated by the current battle between economic growth and the harm created by burning fossil fuels. The status of the world's climate and projections for the disruptive effects of global warming on future populations, migration, economics, and world strife are debated against the backdrop of an increasing world population and the drive by developing nations to achieve economic parity with the industrialized nations. Within the context of increased world strife, the quest by nations to obtain nuclear weapons is also discussed. The steps taken by the world to limit nuclear weapons proliferation are examined with emphasis on potential links between nuclear power generation and access to nuclear weapons. The final chapter discusses the moral responsibility of current generations with respect to future generations, specifically the applicability of intergenerational equity in political and social decision making regarding the actions that add to global warming and those risk-averse actions that can be taken to minimize global warming.

Long-Term Institutional Management of U.S. Department of Energy Legacy Waste Sites National Research Council, Commission on Geosciences, Environment, and Resources, Board on Radioactive Waste Management, Committee on the Remediation of Buried and Tank Wastes, 2000-11-09 It is now becoming clear that relatively few U.S. Department of Energy (DOE) waste sites will be cleaned up to the point where they can be released for unrestricted use. Long-term stewardship activities to protect human health and the environment from hazards that may remain at its sites after cessation

of remediation will be required for over 100 of the 144 waste sites under DOE control U S Department of Energy 1999 After stabilizing wastes that remain on site and containing them as well as is feasible DOE intends to rely on stewardship for as long as hazards persist in many cases indefinitely Physical containment barriers the management systems upon which their long term reliability depends and institutional controls intended to prevent exposure of people and the environment to the remaining site hazards will have to be maintained at some DOE sites for an indefinite period of time The Committee on Remediation of Buried and Tank Wastes finds that much regarding DOE s intended reliance on long term stewardship is at this point problematic The details of long term stewardship planning are yet to be specified the adequacy of funding is not assured and there is no convincing evidence that institutional controls and other stewardship measures are reliable over the long term Scientific understanding of the factors that govern the long term behavior of residual contaminants in the environment is not adequate Yet the likelihood that institutional management measures will fail at some point is relatively high underscoring the need to assure that decisions made in the near term are based on the best available science Improving institutional capabilities can be expected to be every bit as difficult as improving scientific and technical ones but without improved understanding of why and how institutions succeed and fail the follow through necessary to assure that long term stewardship remains effective cannot reliably be counted on to occur Long Term Institutional Management of U S Department of Energy Legacy Waste Sites examines the capabilities and limitations of the scientific technical and human and institutional systems that compose the measures that DOE expects to put into place at potentially hazardous residually contaminated sites *The Nuclear Waste Policy Act of 1997* United States.
