Soft Condensed Matter Physics in Molecular and Cell Biology W. C. K. Poon, David Andelman, 2019-10-17 Soft condensed matter physics which emerged as a distinct branch of physics in the 1990s studies complex fluids liquids in which structures with length scale between the molecular and the macroscopic exist Polymers liquid crystals surfactant solutions and colloids fall into this category Physicists deal with properties of soft matter systems that are generic and largely independent of chemical details They are especially fascinated by the way soft matter systems can harness Brownian motion to self assemble into higher order structures Exploring the generic properties of soft matter offers insights into many fundamental questions that cut across a number of disciplines Although many of these apply to materials and industrial applications the focus of this volume is on their applications in molecular and cell biology based on the realization that biology is soft matter come alive The chapters in *Soft Condensed Matter Physics in Molecular and Cell Biology* originated as lectures in the NATO Advanced Science Institute ASI and Scottish Universities Summer Schools in Physics with the same name they represent the thinking of seventeen experts operating at the cutting edge of their respective fields The book provides a thorough grounding in the fundamental physics of soft matter and then explores its application with regard to the three important classes of biomacromolecules proteins DNA and lipids as well as to aspects of the biology of cells The final section of the book considers experimental techniques covering single molecule force spectroscopy of proteins the use of optical tweezers along with X ray neutron and light scattering from solutions While this work presents fundamentals that make it a suitable text for graduate students in physics it also offers valuable insights for established soft condensed matter physicists seeking to contribute to biology and for biologists wanting to understand what the latest think

Forces, Growth and Form in Soft Condensed Matter: At the Interface between Physics and Biology A.T. Skjeltop, A.V.

Belushkin, 2006-01-11 This volume comprises the proceedings of a NATO Advanced Study Institute held at Geilo Norway 24 March 3 April 2003 the seventeenth ASI in a series held every two years since 1971 The objective of this ASI was to identify and discuss areas where synergism between modern physics soft condensed matter and biology might be most fruitful The main pedagogical approach was to have lecturers focussing on basic understanding of important aspects of the relative role of the various interaction electrostatic hydrophobic steric conformational van der Waals etc Soft condensed matter and the connection between physics and biology have been the themes of several earlier Geilo Schools A return to these subjects thus allowed a fresh look and a possibility for defining new directions for research Examples of soft materials which were discussed at this ASI included colloidal dispersions gels biopolymers and charged polymer solutions polyelectrolytes protein membrane complexes nucleic acids and their complexes Indeed most forms of condensed matter are soft and these substances are composed of aggregates and macromolecules with interactions that are too weak and complex to form crystals spontaneously A characteristic feature is that small external forces slight perturbations in temperature pressure or concentration can all be enough to induce significant structural changes Thermal fluctuations are almost by definition strong in soft materials and entropy is a predominant determinant of structure so that disorder slow dynamics and plastic deformation are the rule Hence the phrase soft condensed matter has been coined
