Foundations of Empirical Software Engineering Barry Boehm,Hans Dieter Rombach,Marvin V. Zelkowitz,2005-05-13

Although software engineering can trace its beginnings to a NATO conference in 1968 it cannot be said to have become an empirical science until the 1970s with the advent of the work of Prof Victor Robert Basili of the University of Maryland In addition to the need to engineer software was the need to understand software Much like other sciences such as physics chemistry and biology software engineering needed a discipline of observation theory formation experimentation and feedback By applying the scientific method to the software engineering domain Basili developed concepts like the Goal Question Metric method the Quality Improvement Paradigm and the Experience Factory to help bring a sense of order to the ad hoc developments so prevalent in the software engineering field On the occasion of Basili's 65th birthday we present this book containing reprints of 20 papers that defined much of his work We divided the 20 papers into 6 sections each describing a different facet of his work and asked several individuals to write an introduction to each section Instead of describing the scope of this book in this preface we decided to let one of his papers the keynote paper he gave at the International Conference on Software Engineering in 1996 in Berlin Germany to lead off this book He better than we can best describe his views on what is experimental software engineering

Software Maintenance - A Management

Perspective Phaneendra Nath Vellanky,2007-10-23 Computer systems play an important role in our society Software drives those systems Massive investments of time and resources are made in developing and implementing these systems Maintenance is inevitable It is hard and costly Considerable resources are required to keep the systems active and dependable We cannot maintain software unless maintainability characters are built into the products and processes There is an urgent need to reinforce software development practices based on quality and reliability principles Though maintenance is a mini development lifecycle it has its own problems Maintenance issues need corresponding tools and techniques to address

them Software professionals are key players in maintenance While development is an art and science maintenance is a craft We need to develop maintenance personnel to master this craft Technology impact is very high in systems world today We can no longer conduct business in the way we did before That calls for reengineering systems and software Even reengineered software needs maintenance soon after its implementation We have to take business knowledge procedures and data into the newly reengineered world Software maintenance people can play an important role in this migration process Software technology is moving into global and distributed networking environments Client server systems and object orientation are on their way Massively parallel processing systems and networking resources are changing database services into corporate data warehouses Software engineering environments rapid application development tools are changing the way we used to develop and maintain software Software maintenance is moving from code maintenance to design maintenance even onto specification maintenance Modifications today are made at specification level regenerating the software components testing and integrating them with the system Eventually software maintenance has to manage the evolution and evolutionary characteristics of software systems Software professionals have to maintain not only the software but the momentum of change in systems and software In this study we observe various issues tools and techniques and the emerging trends in software technology with particular reference to maintenance We are not searching for specific solutions We are identifying issues and finding ways to manage them live with them and control their negative impact
