Computer systems play an important role in our society Software drives those systems Massive investments of time and resources are made in developing and implementing these systems Maintenance is inevitable It is hard and costly Considerable resources are required to keep the systems active and dependable We cannot maintain software unless maintainability characters are built into the products and processes There is an urgent need to reinforce software development practices based on quality and reliability principles Though maintenance is a mini development lifecycle it has its own problems Maintenance issues need corresponding tools and techniques to address them Software professionals are key players in maintenance While development is an art and science maintenance is a craft We need to develop maintenance personnel to master this craft Technology impact is very high in systems world today We can no longer conduct business in the way we did before That calls for reengineering systems and software Even reengineered software needs maintenance soon after its implementation We have to take business knowledge procedures and data into the newly reengineered world Software maintenance people can play an important role in this migration process Software technology is moving into global and distributed networking environments Client server systems and object orientation are on their way Massively parallel processing systems and networking resources are changing database services into corporate data warehouses Software engineering environments rapid application development tools are changing the way we used to develop and maintain software Software maintenance is moving from code maintenance to design maintenance even onto specification maintenance Modifications today are made at specification level regenerating the software components testing and integrating them with the system Eventually software maintenance has to manage the evolution and evolutionary characteristics of software systems Software professionals have to maintain not only the software but the momentum of change in systems and software In this study we observe various issues tools and techniques and the emerging trends in software technology with particular reference to maintenance We are not searching for specific solutions We are identifying issues and finding ways to manage them live with them and control their negative impact *Experiences in Software Evolution and Reuse* Svein Hallsteinsen,Maddali Paci,2012-12-06

If implementing systematic reuse is risky not doing it is even more risky Trying systematic reuse unsuccessfully can cost precious time and resources and may make management sceptical of trying it again But if your competitors do it successfully and you do not you may lose market share and possibly an entire market W B Frakes and S Isoda 1994 Software companies today are faced with new and more challenging market pressures In response to this challenge they have to reduce the time to market with new or enhanced products increase the diversity of products available to the customers and enhance the standardisation and interoperability of the products At the same time many

companies carry the burden of large legacy systems that have become too expensive to maintain and cannot sustain the demands of the marketing department for alterations leading to business opportunities being lost BEN95 However the systems are very valuable and cannot be simply replaced because of the costs that such an operation entails Simply replacing them may be too expensive because of the huge volumes of on line data that must be converted among other reasons
