The Changing Global Environment S. Fred Singer, 1975-03-31 We know a great deal about historical climate and its variations from various geo logical studies There are two points worth remarking on One is that the climate changes frequently and radically but that the degree of variation and even sense of variation depends on the time

scale which we are considering Secondly that this is a most unusual geological period for the Planet Earth we are living in a period of mountain building and glaciations whereas during most of the last 250 million years m y there was little ice and little topography A good view of climate change of the last hundred m y can be gained by looking at the paper of Kellogg We are now in a period of extensive glaciations The previous interval occurred 300 to 250 m y ago when even the Sahara was glaciated Of course it was at that time near the position of the South Pole we know that 300 m y ago the continents had not broken apart and formed one land mass Apparently between 250 and 20 m y ago there was little ice on the Earth even at Antarctica Continental basins were flooded by shallow seas This was the period when plant life and marine life proliferated and when most of our fossil fuels were laid down Global Effects of Environmental Pollution S.F. Singer,2012-12-06 The Symposium on the Global Effects of Environmental Pollution has performed an important task it has helped to determine the world wide impact of certain types of local pollution and has uncovered certain unsuspected effects that might hold dangerous implications for the future This Symposium should help to make the world aware of a crisis that is becoming more ominous and that involves the developing as well as the developed countries the crisis of the human environment The causes of this crisis are not difficult to discern There has been an unprecedented increase in the world s population an ever increasing rate of urbanization and in many countries a continuous process of industrialization Essentially advancing technology has made it possible for a minority of mankind to achieve affluence and holds out hope for improving the well being of the great majority But because it has not been integrated into the natural environment this very technology in industry in agriculture or in transport is having many undesirable and potentially catastrophic consequences Our air our water and our soil are in grave danger Many species of animal and plant life have become extinct or are facing extinction The loss to mankind is grave and even the future of life on earth may be in danger The challenge is to find ways of repairing the harm already done and to prevent further harm **Essentials of Medical Geology** Olle Selinus,2013-03-30 **Essentials of Medical Geology** reviews the essential concepts and practical tools required to tackle environmental and public health problems It is organized into four main sections The first section deals with the fundamentals of environmental biology the natural and anthropogenic sources of health elements that impact health and illustrate key biogeochemical transformations The second section looks at the geological processes influencing human exposure to specific elements such as radon arsenic fluorine selenium and iodine The third section presents the concepts and techniques of pathology toxicology and epidemiology that underpin investigations into the human health effects of exposure to naturally occurring elements The last section provides a toolbox of analytical approaches to environmental research and medical geology investigations **Essentials of Medical Geology** was first published in 2005 and has since won three prestigious rewards The book has been recognized as a key book in both medical and geology fields and is widely used as textbook and reference book in these fields For this revised edition editors and authors have updated the content that evolved a lot during 2005 and added two new chapters on

public health and agriculture and health This updated volume can now continue to be used as a textbook and reference book for all who are interested in this important topic and its impacts the health and wellbeing of many millions of people all over the world Addresses key topics at the intersection of environmental science and human health Developed by 60 international experts from 20 countries and edited by professionals from the International Medical Geology Association IMGA Written in non technical language for a broad spectrum of readers ranging from students and professional researchers to policymakers and the general public Includes color illustrations throughout references for further investigation and other aids to the reader
