

Tapping the Sun's Energy

Solar panels, or photovoltaic cells, harness energy from the sun. The cells are made of a semiconductive material that is specially treated so that the sun's rays help create a flow of electrons, which can be used to power your home.

The sun gives off about 400 trillion trillion watts of power.

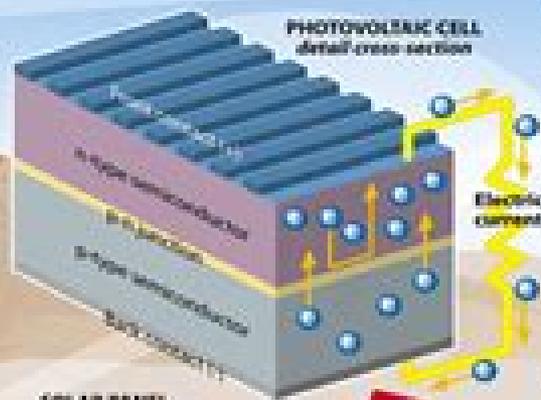

A lot of the sun's energy is reflected back into space or absorbed by the Earth's atmosphere. An average of 1,000 watts hits each square meter of the Earth's surface during peak times, more energy per hour than the global population uses in a year.

PV cell at a glance

A photovoltaic (or PV) cell is a specially treated wafer of silicon, sandwiched between two thin contact plates. The top contact is positively charged and the back contact is negatively charged, making it a semiconductor.

- ▶ The **n-type semiconductor** has an abundance of electrons, giving it a negative charge, while the **p-type semiconductor** is positively charged.
- ▶ Electron movement at the **p-n junction** produces an electric field that allows only electrons to flow from the p-type layer to the n-type layer.
- ▶ When sunlight hits the solar cell, its energy knocks electrons loose from the atoms in the semiconductor.
- ▶ When the electrons hit the electrical field, they're shuffled to the top contact plate and become a usable electric current.

Solar panel form shows much energy a solar panel can make depends on how efficiently it converts the sun's energy. An average solar panel around a square meter in size can generate about 100 watts. Commercial panels are up to 17% efficient, and are getting better every day.

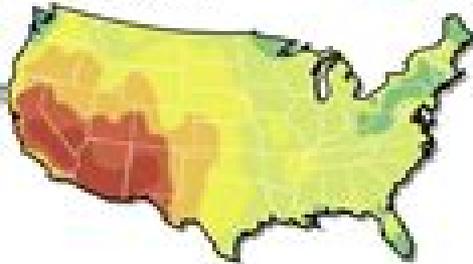

Feeding the grid

Excess energy from the solar array is fed into the power grid. It helps provide extra electricity to the community, especially during peak daytime hours. More than 35 U.S. states have laws that require net metering, which means that solar panel owners get to subtract the amount of energy produced by their solar panels from the energy they draw from the grid on their monthly bill.

Solar potential in the U.S.

The amount of energy striking almost any part of the Earth is vast, regardless of region, season, time of day, climate and air pollution. Shown is the average radiation received on a horizontal surface across the continental United States in the month of June.

The Climate Solutions Consensus National Council for Science and the Environment,2012-06-22 In 2007 the Intergovernmental Panel on Climate Change shared the 2007 Nobel Peace Prize with former Vice President Al Gore for its reporting on the human causes of climate change In 2008 the National Council for Science and the Environment reported that the acceleration of climate change is already faster than the IPCC projected only a year earlier How we deal with the rapid environmental changes and the human forces that are driving these changes will be among the defining issues of our generation Climate Solutions Consensus presents an agenda for America It is the first major consensus statement by the nation s leading scientists and it provides specific recommendations for federal policies for state and local governments for businesses and for colleges and universities that are preparing future generations who will be dealing with a radically changed climate The book draws upon the recommendations developed by more than 1200 scientists educators and decision makers who participated in the National Council for Science and the Environment s 8th National Conference on Science Policy and the Environment After presenting a lucid narrative of the science behind climate change and its solutions Climate Solutions Consensus presents 35 practical results oriented approaches for minimizing climate change and its impacts It clearly spells out options for technological societal and policy actions And it deals head on with controversial topics including

nuclear energy ocean fertilization and atmospheric geo engineering One of the book s key conclusions is that climate solutions are about much more than energy sources They involve re examining everything people do with an eye toward minimizing climate impacts This includes our eating habits consumption patterns transportation building and housing forestry land use education and more According to these scientists the time to act is now With clarity and urgency they tell us exactly what needs to be done to start reversing the driving factors behind climate change minimizing their consequences and adapting to what is beyond our power to stop
