

Solidification During Casting of Metal-Matrix Composites

Pradeep Rohatgi and Benjamin Schultz, University of Wisconsin—Milwaukee
Nikhil Gupta, Polytechnic Institute of New York University
Anil Dasari, Central Metallurgical Research and Development Institute

METAL-MATRIX COMPOSITES (MMC's) are engineered combinations of two or more materials in which reinforcing phases are dispersed in a metal or an alloy. Structurally, cast MMC's consist of continuous or discontinuous fibers (designated by the subscript f), whiskers (w), or particles (p) in a metal or an alloy that solidifies in the restricted spaces between the reinforcing phase (or phases) to form the bulk of the matrix. There are several cast materials, such as aluminum-silicon alloys and cast iron, that exhibit two-phase microstructure in which the volume and shape of the phases are governed by phase equilibria and that have a long history of foundry production. Modern cast MMC's differ from these traditional materials in that any selected volume, shape, and size of reinforcement can be introduced into the matrix, even beyond the permissible limits presented by the phase diagrams.

By carefully controlling fiber size, shape, surface properties, volume fraction, and distribution of the reinforcement and by controlling the solidification conditions, MMC's can be synthesized having a tailored set of useful engineering properties. For example, as shown in Table 1, combinations of very high specific strength and specific modulus, beyond those of conventional monolithic alloys, are achievable. Table 2 summarizes the applications of several commonly used MMC's and the properties that make them suitable for

their applications. Microstructural design and synthesis procedures have been developed to achieve unique combinations of properties, including improved elevated-temperature and fatigue strengths, increased damping ability, tailored electrical and thermal conductivities,

reduced wear rates, and targeted coefficients of thermal expansion. These tailored properties provide opportunities for a variety of new applications for MMC's that were not possible using conventional materials. For more information about MMC types and their applications, see the

have also been experimentally observed in the microstructures of cast particulate composites with the exception of primary α aluminum surrounding the reinforcement. The absence of α aluminum on the reinforcements is attributed to possible lack of nucleation, persistent lateral growth and a thermal lag between the reinforcement and the matrix. Estimates of works of adhesion for the different interfaces observed in cast composites have been made using the London Van der Waal equation correlated to the properties of the composites and used to identify the possibilities of further improving these properties.

Metal Matrix Composites in Industry Alexander Evans, Christopher San Marchi, Andreas Mortensen, 2013-11-27 Metal matrix composites are making tangible inroads into the real world of engineering. They are used in engineering components such as brake rotors, aircraft parts, combustion engines and heat sinks for electronic systems. Yet outside a relatively limited circle of specialists, these materials are mostly unknown. Designers do not as a rule think of using these materials in part because access to information is difficult as these materials have not really entered engineering handbooks. Metal Matrix Composites in Industry is thus useful to engineers who wish to gain introductory knowledge of these materials and who want to know where to find them. Additionally, it provides researchers and academics with a survey of current industrial activity in this area of technology.

Metal Matrix Composites J. Paulo Davim, 2014-10-24 Metal Matrix Composites (MMC)s have found an increased use in various industries due to their special mechanical and physical properties. They are a composite material with at least two constituent parts, one being a metal and are made by dispersing a reinforcing material into a metal matrix. The markets are telecommunications, automotive, power, semiconductor, opto electronics, military and aerospace, heavy transportation, space systems and satellites, medical and industrial lighting. Applications within these markets include microwave, micro electronic packaging, laser diode, HB LED s and advanced radar.
