

THE SOCIOLOGY OF HUMAN FERTILITY: A TREND REPORT AND BIBLIOGRAPHY

by

RONALD FREEDMAN

I. INTRODUCTION

A. POSTWAR INTEREST IN THE SOCIOLOGY OF HUMAN FERTILITY

Interest in the sociology of human fertility has increased greatly in the postwar period among social scientists, administrators, political leaders, and the informed public in many countries. The background for this increasing interest is an inter-related complex of changes in society itself and in knowledge about population and society.

1. *There is an increasing realization that the problematic factor in population growth today is the fertility rate.* Growth rates in most countries are little affected by international migration; they depend mainly on mortality and fertility levels. In the under-developed areas mortality either already has fallen to low levels or can be predicted to do so soon with the probable application of existing knowledge. Since fertility rates are expected to remain high for at least a time, the increasingly rapid rate of growth resulting from mortality decline is regarded by most development experts as a threat to programs of economic and social development [564].¹ So, a variety of people concerned with these programs are eager for knowledge which can be used in action programs to accelerate fertility decline.

Research also is demonstrating with more precision that population growth rates in the developed countries, too, now depend mainly on fertility trends [636]. Mortality is now so low in these countries that increases in life expectancy will have relatively small effects on population growth. This is true partly because only modest mortality decreases are likely. More important is the fact that almost everyone in such societies now lives through the child-bearing years, but it is only mortality gains in the child-bearing years which affect population growth with the effect of a compound-interest multiplier. Increasing life expectancy for older people does not have this effect, but any change in fertility does. Ansley Coale [636] has illustrated dramatically the consequences of this situation in a calculation showing that the attainment of immortality for the entire population of the United States would have less effect on its long-run growth than a 20% increase in fertility! Recent work has demonstrated that with low Western mortality rates quite a rapid rate of population growth can result with moderate-size families of three children, for example.

Before the war, most demographers simply expected fertility rates to continue to decline or to stabilize at very low levels as effective contraception spread in an increasingly urbanized population. Since prewar population projections erred mainly in failing to allow adequately either for the possibility of higher fertility rates or for their volatility, demographers have begun to turn to more broadly based social research on fertility for better predictions of this element in population growth.

The dynamic character of the fertility rates has been emphasized by the rebound and then stabilization of fertility after the war at or above replacement levels in most Western countries and by the persistence of even higher rates and larger families in the overseas Western countries since the postwar "baby-boom". Apparently,

¹ The figures enclosed in square brackets refer to items in the Bibliography.
