**Biogeography** James Allan Taylor, 1984-01-01 Biogeography has been one of the great growth areas in geography in recent years with much new

research work and many new developments taking place This book presents an authoritative up to date international review of all the major biogeographical themes The chapters define each theme and its place within biogeography and consider the methods of study adopted Each chapter then assesses recent trends and the latest state of the art and concludes by examining where future developments are likely Many case studies and examples are provided from throughout the world including North America

**Themes in Biogeography** J. A. Taylor, 2019-10-01 Originally published in 1984 Themes in Biogeography presents a broad examination of biogeographical themes extending across the field of plant and animal ecology and geography The book provides a detailed and unique investigation into life and its environment and delves into not just geography and ecology but provides an interdisciplinary look at these areas across both biological and environmental sciences The book examines biogeographical themes applying them to areas of research in soils and climate change as well as in depth studies of plant communities and their animal associates The book also discusses plants and animals through their taxonomic distribution and deals with factors of plant geography using both global and regional examples This book will be of interest to biologists ecologists and geographers alike

Gravitational Systems of Groundwater Flow József Tóth, 2009-04-16 This book recognizes groundwater flow as a fundamental geologic agent and presents a wide ranging and illustrated overview of its history principles scientific consequences and practical utilization The author one of the founding fathers of modern hydrogeology highlights key interrelationships between seemingly disparate processes and systems by tracing them to a common root cause gravity driven groundwater flow Numerous examples demonstrate practical applications in a diverse range of subjects including land use planning environment protection wetland ecology agriculture forestry geotechnical engineering nuclear waste disposal mineral and petroleum exploration and geothermal heat flow The book contains numerous user friendly features for a multidisciplinary readership including full explanations of the relevant mathematics emphasis on the physical meaning of the equations and an extensive glossary It is a key reference for researchers consultants and advanced students of hydrogeology and reservoir engineering

Martini,W. Chesworth,2013-10-22 For the past 200 years geological scientists have used the present as a key to unlocking the past This volume continues the tradition by exploring the processes of weathering and soil formation as indicators of the present environment of the Earth s land surface Examined are the various ways in which this information can be used to interpret past environments which have produced the soils now preserved as paleosols Because the surface environment of the earth may now be undergoing rapid change the greenhouse effect the book is a timely one for those

researchers looking for evidence of analogous changes in the Earth's past. The work is divided into three major sections. The first deals with fundamental considerations of weathering, clay mineralogy and diagenesis. The second deals with the formation of soils from various starting materials and in various surficial environments. And the final section is an interpretation of paleosols. This volume provides valuable reading material for graduate and senior undergraduate courses.

*Geocology: An Evolutionary Approach* Richard Huggett, 2002-09-11. Animals, plants and soils interact with one another with the terrestrial spheres and with the rest of the Cosmos. On land, this rich interaction creates landscape systems or geoecosystems. Geocology investigates the structure and function of geoecosystems, their components and their environment. The author develops a simple dynamic systems model, the Brash equation, to form the conceptual framework for the book, suggesting an ecological and evolutionary approach. Exploring internal ecological interactions between geoecosystems and their near-surface environments, the atmosphere, hydrosphere, toposphere and lithosphere, and external influences, both geological and cosmic. Geocology presents geoecosystems as dynamic entities constantly responding to changes within themselves and their surroundings. An evolutionary view emerges of geoeological systems and the animals, plants and soils comprising them, providing a new way of thinking for the whole environmental complex and the rich web of interdependencies contained therein.
