Polymer Crystallization Günter Reiter,Jens-Uwe Sommer,2008-01-11 The classical view on polymer crystallization basically focused on the explanation of a few macroscopically observable parameters like the thickness of the resulting lamellar structure and the corresponding growth rates However the emerging paradigm for the description of chain crystals is too simple and cannot account for the complex non equilibrium processes responsible for structure formation on various levels ranging from the nanometer up to the millimeter scale This complexity detected by several novel experimental results led to a renewed interest in this old topic of polymer crystallization These new findings concern the early stages of the crystallization process crystal formation in confined geometries like ultra thin films and the competition between micro phase separation and crystallization in copolymers and blends In particular high spatial resolution techniques such as atomic force microscopy provided deeper insight into the molecular organization of crystallizable polymers Computer simulations based on microscopic processes were used to improve our understanding of how polymer crystals are nucleated and how they grow New ideas emerged about possible multistage pathways which are followed during the formation of polymer lamellae The importance and the consequences of the non equilibrium character of polymer crystals got significantly more attention Links and analogies to growth phenomena and pattern formation in general are being developed However these ideas are still subject of intensive and controversial discussions

Developments in Crystalline Polymers—1 David C. Bassett, 2013-04-17 Crystalline or more properly semi crystalline polymers continue to present major challenges and opportunities to scientists and technologists alike On the one hand scientific understanding of their structure and properties still lags behind that of other economically important but less complicated materials On the other hand there remains very considerable potential for improving properties in systems designed for specific purposes Ways are only just being found of transferring inherent molecular properties such as high modulus to the macromolecular solid Beyond these are many possibilities of manipulating the organization of chemical and physical textures towards desired ends The chapters in this volume are reports by well known and active researchers on some of the important recent developments of these themes Grubb begins with the fundamental and central problem of determining polymeric microstructure Polymers suffer by comparison with other materials in that it has not generally been possible to exploit the high resolution of the electron microscope to determine their microstructure in adequate detail However recently ways have been found of studying representative lamellar textures in melt crystallized polymers When fully exploited these must add

greatly to our detailed knowledge and provide a firmer fundamental base for future developments Radiation damage bears the primary responsibility for restricting electron microscopy In his chapter Kener recounts how appreciation of this fact led him into a fascinating study of ever deeper aspects of radiation damage in polyethylene over two decades often controversial but invariably clarifying the basic understanding of an area now of increasing commercial importance
