Direct Strip Casting of Metals and Alloys M

Ferry,2006-03-24 Direct strip casting is a continuous casting process for producing metallic sheet directly from the molten state that minimises the need for substantial secondary processing This important book is the first to review the implications of strip casting technology for a range of alloys including carbon and stainless steel aluminium magnesium titanium copper and other non ferrous alloys The book is divided into six chapters with the first two describing the physical metallurgy of candidate alloys for direct strip casting and the development of microstructure during solidification Chapter 3 describes the principles of continuous casting processes and the evolution of direct strip casting It provides the foundation for the following two chapters which describe process variables and their impact on microstructure and strip quality The final chapter describes possible techniques in secondary processing and fabrication of the as cast strip Two appendices discuss

simulation and modelling issues and the measurement and representation of textures in metal strip Direct strip casting of metals and alloys is a standard reference on a technology destined to have a profound impact on the manufacturing landscape of the twenty first century First book to review the implications of strip technology for a range of alloys Essential book on a technology destined to have a profound impact on the manufacturing landscape of the twenty first century

Solidification and Cast Structure I. Minkoff, 1986-08-11 This practical guide presents a comprehensive account of solidification processes in metals and alloys and describes the manner in which cast structure arises Reviews the principle features of solidification theory in an accessible and easily understood manner Relates the solidification and cast structure process to different industrial processes such as conventional casting continuous casting welding and rapid solidification Provides concise descriptions of structure formation in cast steel cast iron and aluminum Includes treatment of cast ceramics glass metal nonmetal structures rapid solidification welding and continuous casting processes

Casting Processes and Modelling of Metallic Materials Zak Abdallah, Nada Aldoumani, 2021-02-24 This book Casting Processes and Modelling of Metallic Materials explores the various casting and modelling activities related to metallic alloy systems The book provides results of research work conducted by experts from all over the globe to add to the research community in the era of the casting process and modelling The book was edited by two experts in the field of materials science and modelling Dr Abdallah and Dr Aldoumani whom both have several publications in peer reviewed journals worldwide conferences and scientific books The book introduces the casting processes and then discusses the various issues and possible solutions Over the past years various models have been proposed and utilized to predict the performance of castings Some of these models proved to be accurate whereas others failed to predict the casting performance The strength of any predictive tool depends on the employment of physically meaningful parameters that replicate the real life conditions This has been illustrated in the current book with such predictive models and finite element FE modelling to illustrate the behaviour of castings in real life conditions

Metallography of Steels: Interpretation of Structure and the Effects of Processing Hubertus Colpaert, 2018-08-01 Updated and translated by Andr Luiz V da Costa e Silva This book is a combination of a metallographic atlas for steels and cast irons and an introductory textbook covering the fundamentals of phase transformations and heat treatment of these materials Every important stage of processing from casting to cold working is clearly discussed and copiously illustrated with metallographs that show the obtained structures both desired and those achieved when deviations occur First published in 1951 by Professor Hubertus Colpaert from the Institute for Technological Research IPT of S o Paulo Brazil this book became one of the most important Brazilian references for professionals interested in the processing treatment and application of steels and cast irons In the Fourth Edition and English translation updated and translated by Professor Andr Luiz V da Costa e Silva the concept of the of the original edition was preserved while the important developments of recent decades both in metallographic characterization and in steel and iron products as well as progress in

the understanding of the transformations that made the extraordinary developments of these alloys possible were added. Most metallographs are of actual industrial materials and a large number originate from industry leaders or laboratories at the forefront of steel and iron development. As steel continues to be the most widely used metallic material in the world, Metallography of Steels continues to be an essential reference for students, metallographers and engineers interested in understanding processing properties structure relationships of the material. The balance between theoretical and applied information makes this book a valuable companion for even experienced steel practitioners. *Materials Processes* Isaac Minkoff, 2012-12-06. This book is designed to give a short introduction to the field of materials processes for students in the different engineering and physical sciences. It gives an overall treatment of processing and outlines principles and techniques related to the different categories of materials currently employed in technology. It should be used as a first year text and a selection made of the contents to provide a one or two term course. It is not intended to be fully comprehensive but treats major processing topics. In this way the book has been kept within proportions suitable as an introductory course. The text has been directed to fundamental aspects of processes applied to metals, ceramics, polymers, glassy materials and composites. An effort has been made to cover as broad a range of processes as possible while keeping the treatment differentiated into clearly defined types. For broader treatments a comprehensive bibliography directs the student to more specialised texts. In presenting this overall view of the field of processes the text has been brought into line with current teaching in the field of materials. The student of engineering in this way may see the challenge and the advances made in applying scientific principles to modern processing techniques. This type of presentation may also be the more exciting one. Eddy-Current Characterization of Materials and Structures George Birnbaum, George M.
