Figure 9-2. Portion of a data table of the elements.

When you use **VLOOKUP**, you must always “look up” in the first column of the defined database and retrieve associated information from a column to the right in the same row; you cannot **VLOOKUP** to the left, for example. In the table shown in Figure 9-2, you cannot use **VLOOKUP** to return the element name corresponding to symbol. If you want to perform a lookup to the left of, or above, the lookup value, you can either construct your own lookup-type function using the **MATCH** function (see later in this chapter) or use the **LOOKUP** function.

GETTING VALUES FROM A TWO-WAY TABLE

A two-way table has two lookup values, usually in the leftmost column and in the top row. The value to be returned from the table is the value located at the intersection of the row and column containing the two lookup values.

Once again we can use **VLOOKUP** to obtain the value from the table. In the preceding example, the value used for the *column_index_num* argument of **VLOOKUP** was the fixed value 2, because we are always going to be returning a value from column 2 of array. In the two-way table example shown in Figure 9-3, *column_index_num* is a variable; we must determine by means of an expression the column from which the desired value is to be returned. The **MATCH** expression can be used to obtain the relative column number in the table corresponding to the lookup value.

To find the value in the table for $T = 950^{\circ}\text{F}$ and $P = 5000$ psia, the expression

=VLOOKUP(B44,\$A\$4:\$P\$34,MATCH(B45,\$B\$3:\$P\$3,1)+1,1)

where the T and P lookup values are entered in cells B44 and B45 respectively, returns the value 0.035 for the viscosity. The same formula, using names instead of references,

=VLOOKUP(T,T_Table,MATCH(P,P_Row,1)+1,1)

returns the value for the viscosity.
