Sources Of Consciousness The Biophysical And Computational Basis Of Thought:

Sources Of Consciousness: The Biophysical And Computational Basis Of Thought Herbert Sydney Green, Terry T Triffet, 1997-07-01 The phenomenon of consciousness has long been one of the great mysteries of life perhaps because it is inexplicable in terms of the deterministic theories of classical science Today there is some consensus that the key to the understanding of the workings of the mind should be sought in the area of indeterministic quantum mechanics but until recently there has been little substantial progress in unravelling the mystery This book is the culmination of several decades of research by the authors in the physical sciences neurosciences and computer sciences with comprehensive summaries and references to related work by many other scientists and presents important advances toward solving the problem Written for the most part in plain language but supported by appropriate symbolism the book is truly interdisciplinary designed for the needs of a wide variety of students and scholars

Computational Intelligence: A Compendium John Fulcher, L. C. Jain, 2008-06-16 Computational Intelligence A Compendium presents a well structured overview about this rapidly growing field with contributions of leading experts in Computational Intelligence The main focus of the compendium is on applied methods tried and proven effective to realworld problems which is especially useful for practitioners researchers students and also newcomers to the field The 25 chapters are grouped into the following themes I Overview and Background II Data Preprocessing and Systems Integration III Artificial Intelligence IV Logic and Reasoning V Ontology VI Agents VII Fuzzy Systems VIII Artificial Neural Networks IX Evolutionary Approaches X DNA and Immune based Computing

Harmony, Perspective, and Triadic Cognition Norman D. Cook, 2012 The big question in the science of psychology is why is human cognition and behavior so different from the capabilities of every other animal species on Earth including our close genetic relations the chimpanzees This book provides a coherent answer by examining those aspects of the human brain that have made triadic forms of perception and cognition possible Mechanisms of dyadic association sufficiently explain animal perception cognition and behavior but a three way associational mechanism is required to explain the human talents for language tool making harmony perception pictorial depth perception and the joint attention that underlies all forms of social cooperation

Understanding Brain and Mind Yehuda Salu, 2001 How can we understand a system as complex as the brain Does the brain use the same operational principles to control physical and mental activities How can we incorporate in a model what we know and what we do not know about the brain The connectionist model presented in this book provides tools for addressing such questions Its nodes represent well established biological facts combined with observations of the overall behaviors of the system The model is based on comparing and contrasting brains computers and neural networks It defines a framework for understanding the relationships between the brain and the mind It can serve both as a starting point for developing Artificial Intelligence applications for all levels of mental activities and as a guide in the search for biological correlates of observed behaviors

Consciousness in Four Dimensions

Richard M. Pico,2002 Richard M Pico unveils a revolutionary new approach to understanding consciousness that pinpoints its origins in the brain Called Rbiological relativity S the approach combines the laws of physics to the latest breakthroughs in neuroscience molecular biology and computational theory to create a coherent four dimensional model for explaining the origins of life and the emergence of complex biological systems from the living cell to the thinking brain

Consciousness and Neural Plasticity Morten Overgaard,Mads Jensen,2012-01-01 In contemporary consciousness studies the phenomenon of neural plasticity has received little attention despite the fact that neural plasticity is of still increased interest in neuroscience We will however argue that neural plasticity could be of great importance to consciousness studies If consciousness is related to neural processes it seems at least prima facie that the ability of the neural structures to change should be reflected in a theory of this relationship Neural plasticity refers to the fact that the brain can change due to its own activity The brain is not static but rather a dynamic entity which physical structure changes according to its use and environment This change may take the form of growth of new neurons the creation of new networks and structures and change within network structures that is changes in synaptic strengths Plasticity raises questions about the relation between consciousness and brain functions If consciousness is connected to specific brain structures as a function or in identity what happens to consciousness when those specific underlying structures change It is therefore possible that the understanding and theories of neural plasticity can have direct consequences for a theory about consciousness For instance theories of strict identity between consciousness and structure may face the serious dilemma to either accept that say the experience of the colour red is fundamentally different in one individual over time due to cortical changes or to abandon the strong identity thesis altogether Were one to pursue a theory according to which consciousness is not an epiphenomenon to brain processes consciousness may in fact affect its own neural basis The neural correlate of consciousness is often seen as a stable structure that is something that is stable over time Considering neural plasticity this is not necessarily so The NCC might change and hence literally change the way a person is conscious What it is about the NCC that can and might change is even though it can be relevant for the relation between the brain and consciousness is still an unanswered question There are hence a lot of questions that might shed light upon the relevant but unknown relations between consciousness and the brain Therefore We hereby propose to do a Research Topic on consciousness and neural plasticity to shed light on these underestimated issues In contemporary consciousness studies the phenomenon of neural plasticity has received little attention despite the fact that neural plasticity is of still increased interest in neuroscience We will however argue that neural plasticity could be of great importance to consciousness studies If consciousness is related to neural processes it seems at least prima facie that the ability of the neural structures to change should be reflected in a theory of this relationship Neural plasticity refers to the fact that the brain can change due to its own activity The brain is not static but rather a dynamic entity which physical structure changes

according to its use and environment This change may take the form of growth of new neurons the creation of new networks and structures and change within network structures that is changes in synaptic strengths Plasticity raises questions about the relation between consciousness and brain functions If consciousness is connected to specific brain structures as a function or in identity what happens to consciousness when those specific underlying structures change It is therefore possible that the understanding and theories of neural plasticity can have direct consequences for a theory about consciousness For instance theories of strict identity between consciousness and structure may face the serious dilemma to either accept that say the experience of the colour red is fundamentally different in one individual over time due to cortical changes or to abandon the strong identity thesis altogether Were one to pursue a theory according to which consciousness is not an epiphenomenon to brain processes consciousness may in fact affect its own neural basis The neural correlate of consciousness is often seen as a stable structure that is something that is stable over time Considering neural plasticity this is not necessarily so The NCC might change and hence literally change the way a person is conscious What it is about the NCC that can and might change is even though it can be relevant for the relation between the brain and consciousness is still an unanswered question There are hence a lot of questions that might shed light upon the relevant but unknown relations between consciousness and the brain Therefore We hereby propose to do a Research Topic on consciousness and neural plasticity to shed light on these underestimated issues

Neural Masses and Fields: Modelling the Dynamics of Brain Activity Karl Friston, 2015-05-25 Biophysical modelling of brain activity has a long and illustrious history and has recently profited from technological advances that furnish neuroimaging data at an unprecedented spatiotemporal resolution Neuronal modelling is a very active area of research with applications ranging from the characterization of neurobiological and cognitive processes to constructing artificial brains in silico and building brain machine interface and neuroprosthetic devices Biophysical modelling has always benefited from interdisciplinary interactions between different and seemingly distant fields ranging from mathematics and engineering to linguistics and psychology This Research Topic aims to promote such interactions by promoting papers that contribute to a deeper understanding of neural activity as measured by fMRI or electrophysiology In general mean field models of neural activity can be divided into two classes neural mass and neural field models The main difference between these classes is that field models prescribe how a quantity characterizing neural activity such as average depolarization of a neural population evolves over both space and time as opposed to mass models which characterize activity over time only by assuming that all neurons in a population are located at approximately the same point This Research Topic focuses on both classes of models and considers several aspects and their relative merits that span from synapses to the whole brain comparisons of their predictions with EEG and MEG spectra of spontaneous brain activity evoked responses seizures and fitting data to infer brain states and map physiological parameters
