

offset 100H. DOS also creates a Program Segment Prefix, or PSP, in memory from offset 0 to 0FFH (See Figure 3.1).

The PSP is really a relic from the days of CP/M too, when this low memory was where the operating system stored crucial data for the system. Much of it isn't used at all in most programs. For example, it contains file control blocks (FCB's) for use with the DOS file open/read/write/close functions 0FH, 10H, 14H, 15H, etc. Nobody in their right mind uses those functions, though. They're CP/M relics. Much easier to use are the DOS handle-based functions 3DH, 3EH, 3FH, 40H, etc., which were introduced in DOS 2.00. Yet it is conceivable these old functions could be used, so the needed data in the PSP must be maintained. At the same time, other parts of the PSP are quite useful. For example, everything after the program name in the command line used to invoke the COM program is stored in the PSP starting at offset 80H. If we had invoked HOST as

```
C:\HOST Hello there!
```

then the PSP would look like this:

At 80H we find the value 0EH, which is the length of "Hello there!", followed by the string itself, terminated by <CR>=0DH. Likewise, the PSP contains the address of the system environment, which contains all of the "set" variables contained in AUTOEXEC.BAT, as well as the path which DOS searches for executables when you type a name at the command string. This path is a nice variable for a virus to get a hold of, since it tells the virus where to find lots of juicy programs to infect.
