Specification Of Software Systems:

Specification of Software Systems Vangalur S. Alagar,K. Periyasamy,1998 This book provides an introduction to program specification illustrating the advantages it confers upon the software development process Covering all three major specification languages Larch VDM and Z the book discusses specification in general the abstraction process the mathematical tools required the main formal methods as well as examples of their use **Specification of Software**

Systems V.S. Alagar,K. Periyasamy,2013-03-14 This is a textbook on software specification emphasizing formal methods that are relevant to requirements and design stages of software development The aim of the book is to teach the fundamental principles of formal methods in the construction of modular and verifiable formal specifications The book introduces several formal specification techniques and illustrates the expressive power of each technique with a number of examples General Characteristics Traditional textbooks on software engineering discuss the difficulties and challenges that lie on the path from requirements analysis to implementation of a software product Most of these books describe some techniques in detail and give hints on implementation of these techniques Only a few among them deal with important software engineering principles and techniques and discuss how a particular technique may be used to implement a given principle There is very little exposure in these books to a rigorous approach to or a systematic study of the construction of verifiable software Those who have acquired an understanding of the fundamental principles of software engineering from traditional textbooks will find the following characteristics of this book quite relevant to the practice of software engineering The book deals with specification The principal characteristic of this book is to discuss formalisms that provide a theoretical foundation for the principles of software engineering and are appropriate to the requirements and design stages of software development

Specification and Design of Software Systems Elod Knuth,E. J. Neuhold,2014-01-15 **Algebraic Foundations of Systems Specification** Egidio Astesiano,Hans-Jörg Kreowski,Bernd Krieg-Brückner,2012-12-06 The aim of software engineering is the provision and investigation of methods for the development of software systems of high quality with correctness as a key issue A system is called correct if it does what one wants if it meets the requirements To achieve and to guarantee correct systems the need of formal methods with rigorous semantics and the possibility of verification is widely accepted Algebraic specification is a software engineering approach of this perspective When Liskov and Zilles Guttag and the ADJ group with Goguen Thatcher Wagner and Wright introduced the basic ideas of algebraic specification in the mid seventies in the U S A and Canada they initiated a very successful and still flourishing new area In the late seventies algebraic specification became a major research topic also in many European countries Originally the algebraic framework was intended for the mathematical foundation of abstract data types and the formal development of first order applicative programs Meanwhile the range of applications has been extended to the precise specification of complete software systems the uniform definition of syntax and semantics of programming languages and to the stepwise development of correct

systems from the requirement definitions to the running programs The activities in the last 25 years have led to an abundance of concepts methods approaches theories languages and tools which are mathematically founded in universal algebra category theory and logic

Specification for Visual Requirements of Work-Centered Software Systems

,2006 Work centered software systems function as inherent work aiding systems Based on the design concept for a work centered support system WCSS these software systems support user tasks and goals through both direct and indirect aiding methods within the interface client In order to ensure the coherent development and delivery of work centered software products WCSS visual requirements must be specified to capture the cognitive aspects of the user interface design A work centered specification language based on the User Interface Markup Language UIML is an effective solution to bridging this gap between cognitive systems engineering and software engineering A visual requirements specification language can capture and describe work centered visual requirements within a semi formal syntax The proposed language can also be easily integrated into a UML object model via the use of UML s extensibility features A specification language for visual requirements could be employed by cognitive engineers and design teams to help convey requirements in a comprehensible format that is suitable for a software engineer Such a solution provides coherency in the software modeling process of developing work centered software systems

Software Systems Specification and Modeling

John Mathenge Kanyaru,2013-02-15 Drawing on the author s industrial experience in software development this book explores system specification and validation It describes the discipline of software requirements engineering along with issues to consider when choosing a specification technique or notation It covers the differences between requirements analysis and construction specification and explains methods for translating specifications into designs The text also describes different approaches to software specification including visual and textual methods It offers many illustrative examples to reinforce concepts and provide clarity PowerPoint slides and solutions manual are available upon qualified course adoption

during the transcription of the results Nowadays a system implemented to perform the function of Babbage's engine would be classed as safety critical That is the failure of the system to produce correct results could result in the loss of human life mass destruction of property in the form of ships and cargo as well as financial losses and loss of competitive advantage for the shipping firm

Engineering Trustworthy Software Systems Jonathan P. Bowen, Zhiming Liu, Zili Zhang, 2020-07-31 This book constitutes the refereed proceedings of the 5th International School on Engineering Trustworthy Software Systems SETSS 2019 held in Chongqing China in April 2019 The five chapters in this volume provide lectures on leading edge research in methods and tools for use in computer system engineering The topics covered in these chapter include Seamless Model based System Development Foundations From Bounded Reachability Analysis of Linear Hybrid Automata to Verification of Industrial CPS and IoT Weakest Preexpectation Semantics for Bayesian Inference Conditioning Continuous Distributions and Divergence K A Semantic Framework for Programming Languages and Formal Analysis Tools and Software Abstractions and Human Cyber Physical Systems Architecture Modelling

Advancing Practical Specification Techniques for Modern Software Systems John L. Singleton, 2018 The pervasive nature of software and the tendency for it to contain errors has long been a concern of theoretical computer scientists Many investigators have endeavored to produce theories tools and techniques for verifying the behavior of software systems One of the most promising lines of research is that of formal specification which is a subset of the larger field of formal methods In formal specification one composes a precise mathematical description of a software system and uses tools and techniques to ensure that the software that has been written conforms to this specification Examples of such systems are Z notation the Java Modeling Language and many others However a fundamental problem that plagues this line of research is that the specifications themselves are often costly to produce and difficult to reuse If the field of formal specification is to advance we must develop sound techniques for reducing the cost of producing and reusing software specifications The work presented in this dissertation lays out a path to producing sophisticated automated tools for inferring large complex code bases tools for allowing engineers to share and reuse specifications and specification languages for specifying information flow policies that can be written separately from program code This dissertation introduces three main lines of research First I discuss a system that facilitates the authoring sharing and reuse of software specifications Next I discuss a technique which aims to reduce the cost of producing specifications by automatically inferring them Finally I discuss a specification language called Evidently which aims to make information flow security policies easier to write maintain and enforce by untangling them from the code to which they are applied
