

## States of Matter

All matter is made up of atoms, but did you know there are three different states of matter? They are solid, liquid, and gas.

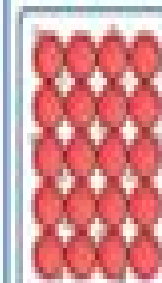

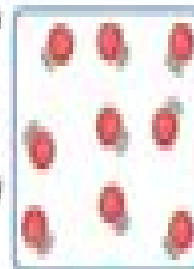

Atoms in a solid state of matter are closely packed together. In fact, they are so tightly packed that they cannot move, only vibrate. Solids have a definite shape and volume. This means the shape and volume do not change. Here are examples of solids: ice, a piece of wood, your body, a computer, your favorite toy, and so on.

Atoms in a liquid are not so closely packed together as in a solid. They are in an organized order but can move a little bit. Liquids have a definite volume but take the shape of the container they are in. For example, if you poured a cup of water into a cylinder or cube, the water will take the shape of the cylinder or cube. Regardless of the container, the volume (how much) will remain the same. Here are examples of liquids: water, milk, oil, and juice.

## States of Matter

Atoms in a gas move freely. They are not in an organized arrangement and have random motion. They have no definite volume and shape. This means their volume and shape change depending on where they are. For example, if you put steam into a big empty pot or into a box, the steam will spread out to fill the container to fill the volume and shape of the container. Here are examples of gases: air, water vapor, oxygen, and nitrogen.

Did you know there is actually a fourth state of matter? It is called plasma. Plasma is the most common state of matter in the universe that isn't any of the other three. Atoms in plasma move very fast (have lots of kinetic energy), and their electrons group together in the atoms and so are instead of different parts. Plasma is present in stars, fluorescent lights, and even some television.

There is also a 5th state of matter called Bose-Einstein condensate (BEC). BEC makes some of molecules together to create a "super molecule." Though not very common, scientists believe BEC matter is found in black holes.
