Subcellular Biochemistry Volume 6:

Subcellular Biochemistry Donald B. Roodyn, 2012-12-06 This volume continues the tradition of SUBCELLULAR BIOCHEMISTRY of trying to break down interdisciplinary barriers in the study of cell function and of bringing the reader's attention to less well studied but nevertheless useful biological systems We start with an extensive article by T P Karpetsky M S Boguski and C C Levy on the structure properties and possible functions of polyadenylic acid Apart from revealing a general lack of appreciation of many important aspects of the chemical properties of poly adenylic acid the literature also shows that there is a great gulf between those who study the biological role of polyadenylic acid and those who study its physicochemical properties The article by Karpetsky and his colleagues is an attempt to overcome this lack of communication and to present an integrated view of the subject The authors go into the subject in full detail and the more biologically inclined reader may on occasion have to reread his nucleic acid physical chemistry notes However the effort is worthwhile and the article is a timely reminder that we cannot treat nucleic acids as mere abstractions but that they are complex organic macromolecules capable of equally complex but nevertheless important interactions The next article is by J Steensgaard and N P Hundahl Møller and deals with computer simulation of density gradient centrifugation systems

Subcellular Biochemistry Donald B. Roodyn, 2011-10-02 The broad aim of this series is to work toward an integrated view of the cell It is perhaps fitting that this tenth volume corresponding to roughly a decade of endeavor in this direction should cover a wide range of topics from apparently disparate subject areas and yet reveal a strong underlying unity of approach in each topic The unifying element is the remarkable extent to which diverse biological processes can now be described even if not fully explained in terms of fundamental molecular biology Chapter 1 by R Douce M A Block A J Dome and J Joyard surveys the great advances that have been made in our understanding of the properties functions and biogenesis of plastid envelope membranes In Chapter 2 G A Peschek deals in a most comprehensive way with respiratory membranes of cyanobacteria blue green algae his article fills a gap in the literature in a subject that is now attracting increasing attention R Sentandreu E Herrero J P Martinez Garcia and G Larriba then describe in Chapter 3 the important advances that have been made in our understanding of the structure and biogenesis of the yeast cell wall B B Biswas B Ghosh and A L Majumder deal in Chapter 4 with a generally neglected area namely the role of myo inositol polyphosphates in metabolism They propose an interesting metabolic cycle involving glucose 6 phosphate and myo inositol phosphates this cycle may well be of general importance in many cell types In Chapter 5 P S

Subcellular Biochemistry Donald B. Roodyn, 1981-10-01 In this volume of SUBCELLULAR BIOCHEMISTRY we cover a wide range of topics of considerable biological importance and have continued in our policy of letting authors rather than editors decide the natural length of their articles Thus we have some short but nevertheless significant contributions as well as more massive chapters We start with a detailed account by I Oelze of the composition and development of the bacterial photosynthetic apparatus A number of photosynthetic bacteria are

discussed with particular emphasis on the well studied *Rhodospirillum rubrum* and *Rhodopseudomonas sphaeroides*. The reader will no doubt be struck by the great wealth of information now available on the molecular organization of the photosynthetic and respiratory systems in these organisms. Equally important is our improved understanding of the biosynthesis and assembly of these systems. It is now generally accepted that photosynthetic bacteria are excellent model systems for the study of bioenergetic processes. It may well be that they will become equally popular as models for the study of membrane biogenesis and it is to be hoped that Oelze's erudite and comprehensive treatment of the subject will help in this regard.

The Enzymes of Biological Membranes Anthony Martonosi, 2013-03-09. In the first edition of *The Enzymes of Biological Membranes* published in four volumes in 1976 we collected the mass of widely scattered information on membrane linked enzymes and metabolic processes up to about 1975. This was a period of transition from the romantic phase of membrane biochemistry preoccupied with conceptual developments and the general properties of membranes to an era of mounting interest in the specific properties of membrane linked enzymes analyzed from the viewpoints of modern enzymology. The level of sophistication in various areas of membrane research varied widely: the structures of cytochrome c and cytochrome b were known to atomic detail while the majority of membrane linked enzymes had not even been isolated. In the intervening eight years our knowledge of membrane linked enzymes expanded beyond the wildest expectations. The purpose of the second edition of *The Enzymes of Biological Membranes* is to record these developments. The first volume describes the physical and chemical techniques used in the analysis of the structure and dynamics of biological membranes. In the second volume the enzymes and metabolic systems that participate in the biosynthesis of cell and membrane components are discussed. The third and fourth volumes review recent developments in active transport, oxidative phosphorylation and photosynthesis.

Plasma Membrane Oxidoreductases in Control of Animal and Plant Growth Frederick Crane, 2013-04-17. The objective of this workshop was to examine the nature of plasma membrane electron transport and how this electron transport contributes to growth of cells. The workshop came at a time when the study of the plasma membrane oxidoreductase activity was beginning to attract more widespread attention from researchers working with both plants and animals. The rapid response of c-fos and c-myc Proto-oncogene to stimulation of plasma membrane redox activity by external oxidants underscores a potential role of plasma membrane oxidoreductases in growth control. Other experiments with isolated endosomes indicate emerging roles in endocytosis and lytic processes. Primary attention was focused on trans plasma membrane electron transport which brings about the oxidation of cytosolic NADH, NADPH or other substrates by electron flow across the plasma membrane to external oxidants including ferric iron, semidehydroascorbate or oxygen. A major theme in the workshop was the relation of this electron flow to pH changes of the cytoplasm or the transfer of protons to the external medium. The presence and role of other oxidoreductases in the plasma membrane was documented especially in regard to peroxide production. In plant cells this may contribute to cellular defense against invading parasites. A

corresponding function in animals has been long known and extensively discussed but was beyond the scope of this workshop

Thiol Metabolism and Redox Regulation of Cellular Functions Alfonso Pompella, Gábor Bánhegyi, Maria Wellman-Rousseau, 2002 This volume contains contributions by some of the leading scientists in the field of thiol oxidation reduction redox biochemistry It is focused on the biological pathophysiological implications of newly discovered functions of cellular thiols such as glutathione in the first place

Recent Advances in Biological Membrane Studies Lester Packer, 2012-12-06 A NATO Advanced Study Institute on New Developments and Methods in Membrane Research and Biological Energy Transduction was held in order to consider some of the most recent developments in membrane research methodologies and results with particular emphasis on studies of biological energy transduction The participants in the Institute dealt with three general areas of membrane study membrane structure with emphasis on lipid and protein components membrane component assembly with particular emphasis on mitochondria and chloroplasts and the specialized functions of certain membrane systems This last area included discussions of topics such as drug transformation the role of membrane electron transport in the generation of oxygen radicals the effect of oxygen radicals on cellular homeostasis and on the structure organization and function of the acetylcholine receptor Lectures and posters were concerned with two central questions what is the function of membrane structure in energy transduction and how can energy transduction be effectively measured and assessed This text presents the content of the major lectures and important posters presented during the Institute's program In issuing this book the editor hopes to convey the proceedings of the Institute to a larger audience and to offer a comprehensive account of those developments in membrane research that were considered on the Island of Spetsai between August 16 and August 29 1984 L Packer Berkeley California February 1985 v

The Meaning of Nucleocytoplasmic Transport Paul S. Agutter, Philip L. Taylor, 2013-06-29 The means by which proteins and RNAs are exchanged between cytoplasm and nucleus have interested cell biologists for many years and the field has seen a number of exciting recent advances Much has been learned about the intricate architecture of the nuclear pore complex the mechanisms by which transport substrates are sorted and the supply of energy for exchange processes This book attempts a general review of the growing body of knowledge However the authors challenge the presumptions implicit in some interpretations of the evidence re examining the concept of transport within cells and suggesting that lessons learned from nucleocytoplasmic transport studies can elucidate wider aspects of cell biology

Calcium-Binding Protein Protocols Hans J. Vogel, 2008-02-05 Calcium plays an important role in a wide variety of biological processes This divalent metal ion can bind to a large number of proteins by doing so it modifies their biological activity or their stability Because of its distinct chemical properties calcium is uniquely suited to act as an on off switch or as a light dimmer of biological activities The two books entitled Calcium Binding Protein Protocols Volumes I and II focus on modern experimental analyses and methodologies for the study of calcium binding proteins Both extracellular and intracellular calcium binding proteins are discussed in detail However proteins involved in calcium handling e.g. calcium pumps and calcium channels fall outside of the scope of these two volumes Also calcium binding proteins involved in bone deposition will not be discussed as this specific topic has been addressed previously The focus of these two books is on studies of the calcium binding proteins and their behavior in vitro and in vivo The primary emphasis is on protein chemistry and biophysical methods Many of the methods described will also be applicable to proteins that do not bind calcium Calcium Binding Protein Protocols is divided into three main sections The section entitled Introduction and Reviews provides information on the role of calcium in intracellular secondary messenger activation mechanisms Moreover unique aspects of calcium chemistry and the utilization of calcium in dairy proteins as well as calcium binding proteins involved in blood clotting are addressed
