*Subsurface Hydrology* George F. Pinder, Michael A. Celia, 2006-09-29 With an emphasis on methodology this reference provides a comprehensive examination of water movement as well as the movement of various pollutants in the earth's subsurface. The multidisciplinary approach integrates earth science, fluid mechanics, mathematics, statistics, and chemistry. Ideal for both professionals and students, this is a practical guide to the practices, procedures, and rules for dealing with groundwater.

**Ground and Surface Water Hydrology** Petre Kozel, 2016 Surface water hydrology is a field that encompasses all surface waters of the globe overland flows, rivers, lakes, wetlands, estuaries, oceans, etc. This is a subset of the hydrologic cycle that does not include atmospheric and ground waters. Surface water hydrology relates the dynamics of flow in surface water systems (rivers, canals, streams, lakes, ponds, wetlands, marshes, arroyos, oceans, etc.). Ground water supplies are obtained from aquifers which are subsurface units of rock and unconsolidated sediments capable of yielding water in usable quantities to wells and springs. The hydrologic characteristics of aquifers and natural chemistry of ground water determine the availability and suitability of ground water resources for specific uses. Ground water is the part of precipitation that enters the ground and percolates downward through unconsolidated materials and openings in bedrock until it reaches the water table. The water table is the surface below which all openings in the rock or unconsolidated materials are filled with water. Water entering this zone of saturation is called recharge. Ground water in response to gravity moves from areas of recharge to areas of discharge. In a general way, the configuration of the water table approximates the overlying topography. In valleys and depressions where the land surface intersects the water table, water is discharged from the ground water system to become part of the surface water system. The interaction between ground water and surface water can moderate seasonal water level fluctuations in both systems. During dry periods, base flow or ground water discharge to streams can help maintain minimum stream flows. Conversely, during flood stages, surface water can recharge the ground water system by vertical recharge on the water-covered flood plain and bank storage through streambed sediments. The net effect of ground

water recharge is a reduction in flood peaks and replenishment of available ground water supplies Ground and Surface Water Hydrology covers fundamentals of subsurface flow and transport emphasizing the role of groundwater in the hydrologic cycle the relation of groundwater flow to geologic structure and the management of contaminated groundwater

Singh,Bhishm Kumar,2012-12-06 Water is vital to life maintenance of ecological balance economic development and sustenance of civilization Planning and management of water resources and its optimal use are a matter of urgency for most countries of the world and even more so for India with a huge population Growing population and expanding economic activities exert increasing demands on water for varied needs domestic industrial agricultural power generation navigation recreation etc In India agriculture is the highest user of water The past three decades have witnessed numerous advances as well as have presented intriguing challenges and exciting opportunities in hydrology and water resources Compounding them has been the growing environmental consciousness Nowhere are these challenges more apparent than in India As we approach the twenty first century it is entirely fitting to take stock of what has been accomplished and what remains to be accomplished and what accomplishments are relevant with particular reference to Indian conditions
