Deutsch-englisches sachwörterbuch Wilhelm Ferdinand Sattler, 1903 Reading Faces Edward Higgs, 2025-10-20
Reading Faces is the first book to discuss the historical contexts and theoretical underpinnings of the artificial intelligence AI systems that identify individuals or purport to ascribe emotions and characteristics to them based on their facial features It examines the direct impact of past research on the development of AI systems the way in which the past provides contexts which have predisposed people to accept outputs of AI systems as common sense how the role of politics and the changing nature of the state have led to the introduction of AI systems and their precursors how previous technologies led to the acceptance of the introduction of superficially similar AIs and how the outputs and biases such as purported associations between race and criminality of facial biometrics systems have been determined by the historical nature of the underlying datasets they analyze Reading Faces approaches these issues within the sweep of Western History how it has shaped conceptual categories about the application and ethics of AI and tried to foist those ideas and values on the Global South This book is essential reading for postgraduates scholars as well as non specialist readers such as booksellers and librarians interested in modern AI technology *Лексикологія англійської мови – теорія і практика. Petridis, 2009-10-28 The most common document formalisation for text classification is the vector space model founded on the bag of words phrases representation The main advantage of the vector space model is that it can readily be employed by classification algorithms However the bag of words phrases representation is suited to capturing only word phrase frequency structural and semantic information is ignored It has been established that structural information plays an important role in classification accuracy 14 An alternative to the bag of words phrases representation is a graph based representation which intuitively possesses much more expressive power However this representation introduces an additional level of complexity in that the calculation of the similarity between two graphs is significantly more computationally expensive than between two vectors see for example 16 Some work see for example 12 has been done on hybrid representations to capture both structural elements in the graph model and significant features using the vector model However the computational resources required to process this hybrid model are still extensive *Encyclopaedia Metropolitana: Religion-Squeak* Edward
