proliferation and survival through changes in gene expression and transcription translation autophagy oxidative stress and apoptosis Dysregulation of these multifaceted polyamine functions contribute to multiple disease processes thus their metabolism and function have been targeted for preventive or therapeutic intervention The correlation between elevated polyamine levels and cancer is well established and ornithine decarboxylase the rate limiting biosynthetic enzyme in the production of putrescine is a bona fide transcriptional target of the Myc oncogene Furthermore induced polyamine catabolism contributes to carcinogenesis that is associated with certain forms of chronic infection and or inflammation through the production of reactive oxygen species These and other characteristics specific to cancer cells have led to the development of polyamine based agents and inhibitors aimed at exploiting the polyamine metabolic pathway for chemotherapeutic and chemopreventive benefit In addition to cancer polyamines are involved in the pathologies of neurodegenerative diseases including Alzheimer s and Parkinson s parasitic and infectious diseases wound healing ischemia reperfusion injuries and certain age related conditions as polyamines are known to decrease with age As in cancer polyamine based therapies for these conditions are an area of active investigation With recent advances in immunotherapy interest has increased regarding polyamine associated modulation of immune responses as well as potential immunoregulation of polyamine metabolism the results of which could have relevance to multiple disease processes The goal of this Special Issue of Medical Sciences is to present the most recent advances in polyamine research as it relates to health disease and or therapy
