K. Stalick, A. D. Mighell, Boreni R. J., 1980 **Characterization of Crystal Growth Defects by X-Ray Methods** B.K. Tanner, 2013-04-17 This book contains the proceedings of a NATO Advanced Study Institute entitled Characterization of Crystal Growth Defects by X ray Methods held in the University of Durham England from 29th August to 10th September 1979 The current interest in electronic materials in particular silicon gallium aluminium arsenide and quartz and the recent availability of synchrotron radiation for X ray diffraction studies made this Advanced Study Institute particularly timely Two main themes ran through the course 1 A survey of the various types of defect occurring in crystal growth the mechanism of their different methods of generation and their influence on the properties of relatively perfect crystals 2 A detailed and advanced course on the observation and characterization of such defects by X ray methods The main emphasis was on X ray topographic techniques but a substantial amount of time was spent on goniometric techniques such as double crystal diffractometry and gamma ray diffraction The presentation of material in this book reflects these twin themes Section A is concerned with defects Section C with techniques and in linking them Section B provides a concise account of the basic theory necessary for the interpretation of X ray topographs and diffractometric data Although the sequence follows roughly the order of presentation at the Advanced Study Institute certain major changes have been made in order to improve the pedagogy In particular the first two chapters provide a vital and seldom articulated case for the need for characterization for crystals used in device technologies **Morphology of Crystals** Ichiro Sunagawa, 1988-02-29 The molecular mechanisms underlying the fact that a crystal can take a variety of external forms is something we have come to understand only in the last few decades This is due to recent developments in theoretical and experimental investigations of crystal growth mechanisms Morphology of Crystals is divided into three separately available volumes Part A contains chapters on

roughening transition equilibrium form step pattern theory modern PBC and surface microtopography This part provides essentially theoretical treatments of the problem particularly the solid liquid interface Part B contains chapters on ultra fine particles minerals transition from polyhedral to dendrite theory of dendrite and snow crystals All chapters are written by world leaders in their respective areas and some can be seen as representing the essence of a life's work This is the first English language work which covers all aspects of the morphology of crystals a topic which has attracted top scientific minds for centuries As such it is indispensable for anyone seeking an answer to a question relating to this fascinating problem mineralogists petrologists crystallographers materials scientists workers in solid state physics and chemistry etc In Parts A Fundamentals and B Fine Particles Minerals and Snow equilibrium and kinetic properties of crystals are generally approached from an atomistic point of view In contrast Part C The Geometry of Crystal Growth follows the alternative and complementary geometrical description where bulk phases are considered as continuous media and their interfaces as mathematical surfaces with orientation dependent properties Equations of motion for a crystal surface are expressed in terms of vector and tensor operators working on surface free energy and growth rate both expressed as functions of surface orientation and driving force or affinity for growth This approach emphasizes the interrelation between equilibrium and kinetic behavior Part 1 establishes the theoretical framework Part 2 gives a construction toolbox for explicit analytic functions An extra chapter is devoted to experimental techniques for measuring such functions a new approach to sphere growth experiments The emphasis throughout is on principles and new concepts Audience Advanced readers familiar with traditional aspects of crystal growth theory Can be used as the basis for an advanced course provided supplementation is provided in the areas of atomistic models of the advancing surface diffusion fields etc *The Encyclopædia Britannica: Constantine Pavlovich-Demidov*, 1910 Physical Properties of Crystals J. F. Nye, 1985 First published in 1957 this classic study has been reissued in a paperback version that includes an additional chapter bringing the material up to date The author formulates the physical properties of crystals systematically in tensor notation presenting tensor properties in terms of their common mathematical basis and the thermodynamic relations between them The mathematical groundwork is laid in a discussion of tensors of the first and second ranks Tensors of higher ranks and matrix methods are then introduced as natural developments of the theory A similar pattern is followed in discussing thermodynamic and optical aspects

**Towards a Theory of Denominals** Adina Camelia Bleotu, 2019-09-02 In *Towards a Theory of Denominals* Adina Camelia Bleotu takes a comparative look at denominal verbs in English and Romanian from various theoretical frameworks such as lexical decomposition distributed morphology nanosyntax and spanning The book proposes a novel spanning analysis arguing for its explanatory superiority to incorporation conflation or nanosyntax in accounting for the formation and behaviour of denominals It provides useful empirical insights drawing from rich data from English discussed widely in the relevant literature but also presenting novel data from Romanian not explored in detail before Many interesting theoretical issues are

also discussed such as the lack of correlation between the un boundedness of the nominal root and the a telicity of the resulting verb the verb satellite framed distinction and others

*Deep Core Studies of the Crystal Structure and Fabrics of Antarctic Glacier Ice* Anthony J. Gow, 1970 Radical differences in the crystal structure and fabrics of glacier ice cores at Byrd Station and Little America V, Antarctica, are attributed to gross differences in the thermal and deformational histories of the ice at these two locations. At Byrd Station, the mean size of crystals increased more than sixfold between 65 meters and the bottom of the drill hole at 309 meters. Crystal size was also found to increase linearly with the age of the ice, thus simulating isothermal grain growth in metals. However, this growth was not accompanied by any dimensional orientation of crystals or entrapped bubbles or by any significant increase in the degree of preferred orientation of crystallographic c axes. These observations imply that negligible shearing is occurring in the top 300 meters of the thick grounded ice sheet at Byrd Station. By contrast, very considerable deformation is indicated for the floating 258 m thick Ross Ice Shelf at Little America. This deformation is characterized by the widespread occurrence of strained crystals below 65 meters, the existence of elongated oriented bubbles between 95 meters and 130 meters, and the attainment of pronounced crystal orientation multiple maxima fabrics by 100 meters depth. Exaggerated growth of crystals below 150 meters is attributed to increasing temperatures in the ice shelf. The crystal structure of these cores clearly demonstrates that glacial ice only is present in the Ross Ice Shelf at Little America V. Author
