Walker, Jinan Wang, Junmei Wang, Haixin Wei, Xiongwu Wu, Yeyue Xiong, Yi Xue, Darrin M. York, Shiji Zhao, Qiang Zhu, Peter A. Kollman, 2023-04-30 Amber is the collective name for a suite of programs that allow users to carry out molecular dynamics simulations particularly on biomolecules. None of the individual programs carries this name but the various parts work reasonably well together and provide a powerful framework for many common calculations.^{1,2} The term Amber is also used to refer to the empirical force fields that are implemented here.^{3,4} It should be recognized however that the code and force field are separate: several other computer packages have implemented the Amber force fields and other force fields can be implemented with the Amber programs. Further, the force fields are in the public domain whereas the codes are distributed under a license agreement. The Amber software suite is divided into two parts: AmberTools²³, a collection of freely available programs mostly under the GPL license, and Amber22, which is centered around the pmemd simulation program and which continues to be licensed as before under a more restrictive license. Amber22 represents a significant change from the most recent previous version, Amber20. We have moved to numbering Amber releases by the last two digits of the calendar year so there are no odd-numbered versions. Please see <https://ambermd.org> for an overview of the most important changes. AmberTools is a set of programs for biomolecular simulation and analysis. They are designed to work well with each other and with the regular Amber suite of programs. You can perform many simulation tasks with AmberTools and you can do more extensive simulations with the combination of AmberTools and Amber itself. Most components of AmberTools are released under the GNU General Public License (GPL). A few components are in the public domain or have other open source licenses. See the README file for more information.

Computer Assisted Radiology / Computergestützte Radiologie AMK Berlin, 2013-03-09 New imaging technology and more sophisticated image processing systems will have a profound effect on those areas of medicine which are concerned with imaging for diagnosis and therapy planning. Digitally formatted data will form the basis of an increasing number of medical imaging modalities. Before the diagnostic imaging department of the future will largely be digital, many problems have still to be solved as regards image quality, costs, and ease of use. The computer and other information science derived methods will contribute towards solving many of the problems in these areas. It is widely expected that there will be an information science derived evolution in imaging for radiology and related departments. Computer assistance may be applied to image generation e.g. CT, MRI, DR and DSR, storing and transferring of images and viewing, analysing and interpreting of images. The application

of computers to these activities which characterise radiological departments may be defined as Computer Assisted Radiology CAR In the main CAR will promote the transition from analog imaging systems to digital systems integration of digital imaging modalities through Picture Archiving and Communication Systems PACS and the graduated employment of Medical Work Stations MWS for diagnosis and therapy planning It will transfer geographically organisationally and or mentally isolate imaging activities towards fully integrated multi imaging modality diagnostic departments This development will have a considerable impact on patient management on the medical profession and on the health care system Advances in Computing and Information - ICCI '90 Selim G.
