

History of the Telescope

It was the invention of the telescope in the 17th century which helped astronomers to discover more about space.

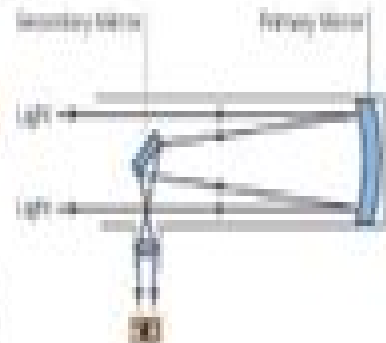

The first telescope was a reflecting telescope, invented by Dutchman Hans Lippershey in 1608. The reflecting telescope bounces light through a lens to produce an image. Using lenses, Lippershey's invention could make faraway objects appear closer. However, one of the problems was that the image quality was poor.

The following year, Galileo Galilei built the first astronomical telescope, having enlarged upon Lippershey's original design. The Galileo worked hard to refine the invention and eventually used it to make the first telescope observations of the sky. He discovered craters and mountains on the Moon and Jupiter's four largest moons, amongst other findings. In 1611, the reflecting telescope was further developed by German astronomer, Johannes Hevelius, who improved upon Galileo's design, resulting in the formation of a much clearer image.

Robert Hooke became interested in astronomy after reading Kepler. In 1674, the Galileo great and astronomer is believed to have been the first person to invent a lens reflecting telescope. A reflecting telescope uses mirrors instead of lenses, which reflect the light in from a much clearer image. The image is produced by reflection from a curved mirror which is then magnified by the second mirror. In 1686, William Herschel further developed the reflecting telescope after studying the reflection of light through glass.

During the 1700s, both reflecting and refracting telescopes were developed further. In 1780, William Herschel built a giant reflector telescope based on Herschel's design, which was 40 feet long.

Throughout the 1800s, telescopes grew in size. Albert Michelson was an American astronomer who built

the world's largest reflecting telescope in 1917, known as the Hooker Telescope. The telescope, which can be found at Lick Observatory in California, holds the largest glass lens possible. If the lens was any bigger, the telescope would begin to collapse under its own weight.

Astronomers came to realize that large telescopes should have mirror-mounted lenses. Today, reflecting telescopes are the most widely used telescopes in the world, by both professional and amateur astronomers.

The 1930s saw the development of the radio telescope, which picks up radio waves, helping astronomers to build a better picture of the universe. Astronomer Sir Bernard Lovell designed a radio telescope measuring five in diameter that could be pointed anywhere in the sky. It was built in 1957 and is located at the Jodrell Bank Observatory, Cheshire, UK.

The world's largest reflecting telescope can be found on the island of La Palma. It is located at Jodrell Bank Observatory, with a mirror diameter of 10.4m, making the most deeply most large telescope will be constructed, with mirror diameter of over 30 metres.

The Hubble Space Telescope was sent into space in 1990. This telescope orbits the Earth and produces some amazing images of stars and galaxies. The James Webb Space Telescope was launched on December 25th, 2021 from the European Space Agency's launch site in Florida, United States. It is the largest and most powerful telescope to date.
