The HLA System in Clinical Transplantation Bjarte G. Solheim, Soldano Ferrone, Erna Möller, 2012-12-06 With this book we want to address young graduate students clinicians involved in transplantation and technicians in transplantation immunology laboratories The volume should give a comprehensive but basic up to date introduction to the structure function and clinical importance of the HLA system We believe that there is a need for such a survey and think that the present level of our knowledge is an optimal occasion for publication A significant number of questions have now been resolved and our knowledge has reached a level of sophistication that provides the basis for additional questions and answers Although the emphasis of this book is on the role of HLA antigens in clinical transplantation their involvement in other clinical contexts is also discussed The main focus is on the human MHC antigenic system but MHC systems in other species are described as they contribute to our understanding of the structural and functional characteristics of HLA antigens Some important issues related to laboratory techniques are also covered The contributors have a close affiliation to the field of transplantation immunology A majority have even been playing important roles in unraveling the HLA system and its functions We believe this has contributed significantly to the quality and clinical and practical relevance of the book As editors we drew up the principal guidelines and took care that the chapters can be read as separate entities although this invariably results in some overlapping

[Attempts to Understand Metastasis Formation III](#) Ursula Günthert,Peter M. Schlag,Walter Birchmeier,2012-12-06 In metastasis tumor cells disseminate from the primary lesion and home to secondary organs where they may remain dormant for a long time Metastasis formation is still the most feared manifestation for tumor patients and clinicians Although improvements have been made concerning earlier detection and specific therapy most of the cancer patients still die of distant metastases The purpose of these three volumes is to review the recent progress in molecular metastasis research and to attempt to further understand the biology of this multifocal process With respect to present day molecular biology the pioneers of metastasis research established the basic concepts of metastasis formation in the 1970s and 1980s namely clonal selection of metastatic cells heterogeneity of metastatic subpopulations organ specificity of metastasis and the importance of angiogenesis Fidler Kripke Nicolson Folkman and others In the 1980s and 1990s several of the molecules involved were identified and their network interactions elucidated These three volumes of Current Topics in Microbiology and Immunology compile the most recent developments on these metastasis related molecules their interactions regulation and ways to interfere with their action It became evident that metastasis related molecules are confined to distinct cellular compartments such as the extracellular space the cell membrane the cytoplasmic signalling network and the nuclear regulatory system For the complex metastatic cascade proteolysis and alterations in adhesive functions are the most obvious and thus one of the most thoroughly investigated processes [Clinical Immunology E-Book](#) Robert R. Molecular Evolution of the Major Histocompatibility Complex Jan Klein,Dagmar Klein,2013-06-29 From molecules to populations and back In biology the most vigorous organisms often ensue from a union of two disparate pure lines In science too laws of hybrid vigor seem to operate at the interface between two disciplines an interface that often proves to be fertile ground for germinating concepts and new outlooks The fringes of research into the major histocompatibility complex Mhc have provided such an interface several times in the past and the encounters have invigorated fields such as transplantation biology cellular immunology and immunogenetics In the last few years a new interface has been emerging between Mhc and evolutionary genetics and particularly the branch of evolutionary genetics dealing with molecular evolution Mhc research relies upon molecular evolutionary genetics with its grand superstructure of mathematical formulations to come to grips with the events leading to and maintaining the Mhc polymorphism Without the armament of rigorous statistical procedures developed by evolutionary geneticists the intricate relationships among Mhc genes cannot be resolved It will undoubtedly be a molecular geneticist who is the final arbiter in the dispute concerning the nature of the selection pressure molding the Mhc genes And it is doubtful whether the true function of Mhc can ever be comprehended without the vantage point afforded by the elucidation of its evolutionary history **Transplantation Biology** Nicholas L.
