Soil Slope Instability and Stabilisation Bruce F. Walker, Robin

Fell, 1987 *Slope Stability and Erosion Control: Ecotechnological Solutions* Joanne E. Norris, Alexia Stokes, Slobodan B.

Mickovski, Erik Cammeraat, Rens van Beek, Bruce C. Nicoll, Alexis Achim, 2008-02-29 This chapter describes the processes involved in the transport of material over hillslopes Hillslopes provide the gradients enabling material to be transported from the slopes themselves towards the valley bottoms directly by gravity alone or by water flowing down over the surface Gravity has the potential to transfer material downslope if the material resistance to counteract it is insufficient Similarly water and wind flowing along the surface exert a drag on soil particles and have the potential to entrain material After the gradient has fallen below a critical threshold to keep the material in transport deposition occurs Conventionally slope processes in which gravity alone is the dominant transporting agent are called mass movements Brunsten 1984 Processes in which other agents dominate are called erosion e.g. wind or water erosion Flowing water is an important transporting agent on which the emphasis is placed here Although mass wasting is a natural process its incidence and impact may be exacerbated by human activities Crozier 1986 Morgan 2005 A situation may ultimately arise in which human interests become unsafe or unsustainable This impact is not only directly felt in the areas where material is removed or deposited and indirectly mass wasting may have an effect on soil and water quality in areas located further downstream In the following sections a brief overview is given of the mechanisms morphology causes and consequences of mass movements and erosion

Rainfall-Induced Soil Slope Failure Lulu Zhang,Jinhui Li,Xu Li,Jie Zhang,Hong Zhu,2018-09-03 Rainfall induced landslides are common around the world With global climate change their frequency is increasing and the consequences are becoming greater Previous studies assess them mostly from the perspective of a single discipline correlating landslides with rainstorms geomorphology and hydrology in order to establish a threshold prediction value for rainfall induced landslides analyzing the slope s stability using a geomechanical approach or assessing the risk from field records Rainfall Induced Soil Slope Failure Stability Analysis and Probabilistic Assessment integrates probabilistic approaches with the geotechnical modeling of slope failures under rainfall conditions with unsaturated soil It covers theoretical models of rainfall infiltration and stability analysis reliability analysis based on coupled hydro mechanical modelling stability of slopes with cracks gravels and spatial heterogenous soils and probabilistic model calibration based on measurement It focuses on the uncertainties involved with rainfall induced landslides and presents state of the art techniques and methods which characterize the uncertainties and quantify the probabilities and risk of rainfall induced landslide hazards Additionally the authors cover The failure mechanisms of rainfall induced slope failure Commonly used infiltration and stability methods The infiltration and stability of natural soil slopes with cracks and colluvium materials Stability evaluation methods based on probabilistic approaches The effect of spatial variability on unsaturated soil slopes and more

Submarine Mass Movements and Their Consequences Jacques Locat,Jürgen Mienert,2012-12-06 Did you know that the Grand Bank earthquake of 1929 triggered a huge submarine mass movement which broke submarine cables over a distance of up to 1000 km from its source and generated a tsunami which devastated a small village in Newfoundland killing 27 people The same happened in Papua New Guinea in 1998 with more than 2000 casualties Submarine mass movements of various sizes and styles are shaping the sea floor and are of concern for many facets of human activities both onshore and offshore These include the development of natural resources energy and communication transport coastal infrastructures and communities This book provides a world wide perspective of submarine mass movements and their consequences This has been made possible by assembling excellent contributions from active researchers groups or institutions thus providing full coverage of the many scientific and engineering aspects of this type of marine and coastal geo hazard It covers fundamental as well as site specific studies from many areas including the Atlantic and Pacific oceans inner seas like the Mediterranean Sea and fjords using the most recent technologies from multibeam sonar imaging techniques 3D seismic analysis slope stability analysis to debris flow and tsunami modeling Audience This book is of interest to any researcher in

the field of marine and coastal geo hazards It will be useful for planners scientists and engineers involved in the development of offshore and near shore resources and also to those in charge of the management and mitigation of coastal hazards For graduate students this book provides an up to date vision of the process of submarine mass movements and their consequences from both a scientific and an engineering standpoint and it includes a unique collection of the existing literature on marine geo hazards CD Rom included This volume contains a CD Rom which in addition to an electronically searchable version of the contributions has full colour versions of figures which are printed in black and white in the book
