Budyko, Alexander B. Ronov, Alexander L. Yanshin, 1987-03-16 The authors of this book have studied the changes in the chemical composition of the atmosphere during geological history with regard to its close relationship to the evolution of the Earth's sedimentary shell. Beginning in 1977 the initial results of this study have been published as articles and parts of several monographs. Since new material clarifying atmospheric evolution have been obtained recently the necessity has arisen to write a book treating the major results of investigations of the history of the atmosphere. In this book much consideration is given to the interrelation between the evolution of animate nature and changes in atmospheric composition. It proved necessary to study the history of the two components of atmospheric air: carbon dioxide and oxygen. Attempts have been made to represent quantitatively the conclusions drawn here, i.e. to determine by calculation the changes in the amount of carbon dioxide and oxygen over much of the history of the atmosphere. These calculations performed in most detail for the Phanerozoic and to a lesser degree for the Late Precambrian are supplemented with estimates of changes in the chemical composition of the atmosphere in the Early Precambrian. Comparisons have been drawn between the changes in the chemical composition of the atmosphere and the development of animate nature, a close relationship being found to exist between the stages of the evolution of organisms and variations in the chemical composition of the atmosphere. *The Story of Earth's Climate in 25 Discoveries* Donald R. Prothero, 2024-03-12 Over 4.5 billion years Earth's climate has transformed tremendously. Before our more temperate recent past the planet swung from one extreme to another from a greenhouse world of sweltering temperatures and high sea levels

to a snowball earth in which glaciers reached the equator During this history we now know living things and the climate have always influenced and even shaped each other But the climate has never changed as rapidly or as drastically as it has since the Industrial Revolution In this lively and entertaining book Donald R Prothero explores the astonishing connections between climate and life through the ages telling the remarkable stories of the scientists who made crucial discoveries Journeying through the intertwined evolution of climate and life he tackles questions such as Why do we have phytoplankton to thank for the air we breathe What kind of climate was necessary for the rise of the dinosaurs or the mammals their successors When and how have climatic changes caused mass extinctions Prothero concludes with the Ice Ages and the Holocene the role of climate in human history and the perils of anthropogenic climate change Understanding why the climate has changed in the past this timely book shows is essential to grasping the gravity of how radically human activity is altering the climate today History of the Earth's Atmosphere Michael I.
