## **Stranded In Grand Canyon Simulation:**

Observations and Modeling of the Internal Tide in a Submarine Canyon Emil T. Petruncio, 1996 Shipboard ADCP and CTD measurements were conducted in Monterey Submarine Canyon in April and October 1994 to determine the propagation characteristics and energy levels of the semidiurnal internal tide. The measurements reveal a bottom intensified internal tide propagating energy up canyon. The region of strongest motion is in a beam 150-200 m thick centered approximately 150 m above the Canyon floor. Along canyon baroclinic M2 currents are typically 15-20 cm s<sup>-1</sup>, an order of magnitude larger than the estimated barotropic tidal currents. In April 1994 the internal tidal beam is well described by a progressive wave while in October 1994 the signal is standing along and perpendicular to the beam. The Princeton Ocean Model was used to study the generation and propagation of semidiurnal internal tides in submarine canyons and to investigate their sensitivity to canyon shape.

Observations and Modeling of Currents Within the Monterey Bay During May 1988 Kim A. Koehler, 1990 April and May of 1988 along the central California coast were characterized as a period of strong coastal upwelling produced by moderate to strong northwesterly winds present throughout the period. A product of this upwelling event was the manifestation of southward geostrophic currents which extended to a distance of approximately 50 km from the coast. From 08 to 11 May 1988 hydrographic surveying was conducted within the Monterey Bay. Internal waves with amplitudes of up to 30 m were present throughout the period and effectively masked the mean signal implying that averaging is essential to avoid aliasing. The current temperature depth CTD data were averaged to estimate the mean field during this time frame. Acoustic Doppler Current Profiler ADCP data were also averaged. The mean flow field and dynamic topography implied anticyclonic surface flow with cyclonic flow at 200 m depth. ADCP derived mean flows compared favorably with geostrophic mean flow rate in all areas except one: the deep outflow region along the northern wall of the Canyon. Application of ocean models of boundary layer flow of the geostrophic mean field yielded flows similar to those described above. Wind stress experiments indicated that strong wind field may influence surface circulation in the Bay. Interactions between the coastal upwelling geostrophic jet and the Monterey Submarine Canyon is believed to have been a major mechanism responsible for the mean flow.

**Ocean Modeling and Parameterization** Eric P. Chassignet, Jacques Verron, 2012-12-06 The realism of large scale numerical ocean models has improved dramatically in recent years in part because modern computers permit a more faithful representation of the differential equations by their algebraic analogs. Equally significant if not more so has been the improved understanding of physical processes on space and time scales smaller than those that can be represented in such models. Today some of the most challenging issues remaining in ocean modeling are associated with parameterizing the effects of these high frequency small space scale processes. Accurate parameterizations are

especially needed in long term integrations of coarse resolution ocean models that are designed to understand the ocean variability within the climate system on seasonal to decadal time scales Traditionally parameterizations of subgrid scale high frequency motions in ocean modeling have been based on simple formulations such as the Reynolds decomposition with constant diffusivity values Until recently modelers were concerned with first order issues such as a correct representation of the basic features of the ocean circulation As the numerical simulations become better and less dependent on the discretization choices the focus is turning to the physics of the needed parameterizations and their numerical implementation At the present time the success of any large scale numerical simulation is directly dependent upon the choices that are made for the parameterization of various subgrid processes

**Grand Central Arena** Ryk Spoor, 2024-12-17 It was supposed to be a simple test flight one that pilot Ariane Austin was on only as a last ditch backup intelligent superhumanly fast automation would handle the test activation and flight

of humanity's first faster than light vessel. But when the Sandrisson Drive activated every automated system crashed, the nuclear reactor itself shut down and only the reflexes and training of a racing pilot saved the test vessel Holy Grail from crashing into the impossible wall that had appeared before them, a wall which is just part of a monstrous enclosure surrounding a space 20 000 kilometers across. With all artificial intelligences inert and their reactor dead, they had to find some other source of power to reactivate the Sandrisson Drive and hopefully take them home. And that was only the beginning. As Ariane, Dr Simon Sandrisson, darkly enigmatic power engineer, Marc C DuQuesne, and the rest of the Holy Grail's crew explore the immense artifact, they discover that they are not alone; they have entered a place the alien inhabitants call The Arena, and there is no way out without joining one of the alien factions or winning recognition as a faction in their own right, playing by the Arena's rules. And by the Arena's rules, one failed challenge could mean death or worse, perhaps for the entire human race. Surrounded by alien factions, each with its own secret plans and motivations, some wielding powers so strange as to be magical, Ariane sets out to beat the Arena at its own game. With DuQuesne's strategies, Sandrisson's genius, and her own unyielding determination, she's going to bring the Holy Grail home, even if she has to beat every faction in the Arena to do it.
