Knight, Edith Kaplan, 2003-01-01 Handbook of Normative Data for Neuropsychological Assessment Maura Mitrushina, 2005-02-10 When Handbook of Normative Data for Neuropsychological Assessment was published in 1999 it was the first book to provide neuropsychologists with summaries and critiques of normative data for neuropsychological tests The Second Edition which has been revised and updated throughout presents data for 26 commonly used neuropsychological tests including Trailmaking Color Trails Stroop Color Word Interference Auditory Consonant Trigrams Paced Auditory Serial Addition Ruff 2 and 7 Digital Vigilance Boston Naming Verbal Fluency Rey Osterrieth Complex Figure Hooper Visual Fluency Design Fluency Tactual Performance Wechsler Memory Scale Revised Rey Auditory Verbal learning Hopkins Verbal learning WHO UCLA Auditory Verbal Learning Benton Visual Retention Finger Tapping Grip Strength Dynamometer Grooved Pegboard Category and Wisconsin Card Sorting tests In addition California Verbal learning CVLT and CVLT II CERAD List Learning and selective Reminding Tests as well as the newest version of the Wechsler Memory Scale WMS III and WMS IIIA are reviewed Locator tables throughout the book guide the reader to the sets of normative data that are best suited to each individual case depending on the demographic characteristics of the patient and highlight the advantages associated with using data for comparative purposes Those using the book have the option of reading the authors critical review of the normative data for a particular test or simply turning to the appropriate data locator table for a quick reference to the relevant data tables in the Appendices The Second Edition includes reviews of 15 new tests The way the data are presented has been changed to make the book easier to use Meta analytic tables of predicted values for different ages and education where relevant are included for nine tests that have a sufficient number of homogeneous datasets No other reference offers such an effective framework for the critical evaluation of normative data for neuropsychological tests Like the first edition the new edition will be welcomed by practitioners researchers teachers and graduate students as a unique and valuable contribution to the practice of neuropsychology The Boston Process Approach to Neuropsychological Assessment Lee Ashendorf PhD, Rod Swenson PhD, ABN, David J. Libon PhD, FACPN, ABN, 2013-07-12 The Boston Process Approach to neuropsychological assessment advanced by Edith Kaplan has a long and well respected history in the field However its theoretical and empirical support has not previously been assembled in an easily accessible format This volume fills that void by compiling the historical empirical and practical teachings of the Process Approach The reader will find a detailed history of the precursors to this model of thought its development through its proponents such as Harold Goodglass Nelson Butters Laird Cermak and Norman Geschwind and its continuing legacy The second section provides a guide to applying the Boston Process Approach to some of the field s most commonly used measures such as the various Wechsler Intelligence Scales the Trail Making Test the California Verbal Learning Test and the Boston Naming Test Here the reader will find a detailed history of the empirical evidence for test

administration and interpretation using Boston Process Approach tenets The final section of the book provides various perspectives on the implementation of the Boston Process Approach in various clinical and research settings and with specialized populations

The Quantified Process Approach to Neuropsychological Assessment Amir M.

Poreh, 2012-12-06 Since the late 1800s psychologists have been interested in discerning the strategies subjects employ to solve psychological tests Piaget 1928 Werner 1940 Gesell 1941 Much of this work however has relied on qualitative observations In the 1970s Edith Kaplan adopted this approach to the analysis of standardized neuropsychological measures Unlike her predecessors Dr Kaplan and her colleagues emphasized the application of modern behavioral neurology to the analysis of the test data Her approach was later termed the Boston Process Approach to neuropsychological assessment While Edith Kaplan's work generates a great deal of enthusiasm the qualitative nature of her analyses did not allow for its adoption by mainstream neuropsychologists However in recent years this limitation has begun to be addressed Clinicians and researchers have developed new methodologies for quantifying the Boston Process Approach leading to the emergence of a new field which is collectively termed the Quantified Process Approach Quantified Process Approach to Neuropsychological Assessment outlines the rationale for the emergence of this new approach and reviews the state of the art research literature and up to date clinical applications as they pertain to the evaluation of neuropsychiatric head injured and learning disabled patients When available norms and scoring forms are included in the appendices

Subcortical Structures and Cognition

Leonard F. Koziol, Deborah Ely Budding, 2009-04-21 Clinical psychologists and neuropsychologists are traditionally taught that cognition is mediated by the cortex and that subcortical brain regions mediate the coordination of movement However this argument can easily be challenged based upon the anatomic organization of the brain The relationship between the prefrontal cortex frontal lobes and basal ganglia is characterized by loops from these anterior brain regions to the striatum the globus pallidus and the thalamus and then back to the frontal cortex There is also a cerebrocerebellar system defined by projections from the cerebral cortex to the pontine nuclei to the cerebellar cortex and deep cerebellar nuclei to the red

nucleus and then back to thalamus and cerebral cortex including all regions of the frontal lobes Therefore both the cortical striatal and cortical cerebellar projections are anatomically defined as re entrant systems that are obviously in a position to influence not only motor behavior but also cognition and affect This represents overwhelming evidence based upon neuroanatomy alone that subcortical regions play a role in cognition The first half of this book defines the functional neuroanatomy of cortical subcortical circuitries and establishes that since structure is related to function what the basal ganglia and cerebellum do for movement they also do for cognition and emotion The second half of the book examines neuropsychological assessment Patients with lesions restricted to the cerebellum and or basal ganglia have been described as exhibiting a variety of cognitive deficits on neuropsychological tests Numerous investigations have demonstrated that higher level cognitive functions such as attention executive functioning language visuospatial processing and learning and memory are affected by subcortical pathologies There is also considerable evidence that the basal ganglia and cerebellum play a critical role in the regulation of affect and emotion These brain regions are an integral part of the brain s executive system The ability to apply new methodologies clinically is essential in the evaluation of disorders with subcortical pathology including various developmental disorders broadly defined to include learning disorders and certain psychiatric conditions for the purpose of gaining greater understanding of these conditions and developing appropriate methodologies for treatment The book is organized around three sources of evidence neuroanatomical connections patients with various disease processes experimental studies including various imaging techniques These three sources of data present compelling evidence that the basal ganglia and cerebellum are involved in cognition affect and emotion The question is no longer if these subcortical regions are involved in these processes but instead how they are involved The book is also organized around two basic concepts 1 the functional neuroanatomy of the basal ganglia and the cerebellum and 2 how this relates to behavior and neuropsychological testing Cognitive neuroscience is entering a new era as we recognize the roles of subcortical structures in the modulation of cognition The fields of neuropsychology cognitive psychology neuropsychiatry and neurology are all developing in the direction of understanding the roles of subcortical structures in behavior This book is informative while defining the need and direction for new paradigms and methodologies for neuropsychological assessment
