Spinal Network:

Advances in Spinal Cord Epidural Stimulation for Motor and Autonomic Functions Recovery After Severe Spinal Cord Injury Enrico Rejc, Ronaldo M. Ichiyama, Claudia A. Angeli, 2022-02-14 Neural Control of Movement W.R. Ferrell, Uwe Proske, 2012-12-06 Presented with a choice of evils most would prefer to be blinded rather than to be unable to move immobilized in the late stages of Parkinson's disease Yet in everyday life as in Neuroscience vision holds the centre of the stage The conscious psyche watches a private TV show all day long while the motor system is left to get on with it out of sight and out of mind Motor skills are worshipped at all levels of society whether in golf tennis soccer athletics or in musical performance meanwhile the subconscious machinery is ignored But scientifically there is steady advance on a wide front as we are reminded here from the reversal of the reflexes of the stick insects to the site of motor learning in the human cerebral cortex As in the rest of Physiology evolution has preserved that which has already worked well thus general principles can often be best discerned in lower animals No one scientist can be personally involved at all levels of analysis but especially for the motor system a narrow view is doomed from the outset Interaction is all the spinal cord has surrendered its autonomy to the brain but the brain can only control the limbs by talking to the spinal cord in a language that it can understand determined by its pre existing circuitry and both receive a continuous stream of feedback from the periphery

Neuromodulatory Control of Spinal Function in Health and Disease Brian R. Noga, Shawn Hochman, Hans Hultborn, 2020-02-20 **Structure-Related Intrinsic Electrical States and Firing Patterns of Neurons With Active Dendrites** Sergey M. Korogod, 2018-10-18 Activity of the multi functional networked neurons depends on their intrinsic states and bears both cell and network defined features Firing patterns of a neuron are conventionally attributed to spatial temporal organization of inputs received from the network mates via synapses in vast majority dendritic This attribution reflects widespread views of the within cell job sharing such that the main function of the dendrites is to receive signals and deliver them to the axo somatic trigger zone which actually generates the output pattern However these views are now revisited due to finding of active non linear properties of the dendritic membrane practically in neurons of practically all explored types Like soma and axon the dendrites with active membrane are able to generate self maintained propagating depolarizations and thus share intrinsic pattern forming role with the trigger zone Unlike the trigger zone the dendrites have complex geometry which is subject to developmental activity dependent or neurodegenerative changes Structural features of the arborization inevitably impact on electrical states and cooperative behavior of its constituting parts at different levels of organization from sub trees and branches to voltage and ligand gated ion channels populating the dendritic membrane More than two decades of experimental and computer simulation studies have brought numerous phenomenological demonstrations of influence of the dendritic structure on neuronal firing patterns A necessary step forward is to comprehend these findings and build a firm theoretical basis including quantitative relationships between geometrical and electrical

characteristics determining intrinsic activity of neurons The articles in this eBook represent progress achieved in a broad circle of laboratories studied various aspects of structure and function of the neuronal dendrites The authors elucidate new details of dendritic mechanisms underlying intrinsic activity patterns in neurons and highlight important questions that remain open in this important domain of cellular and computational neuroscience
