*Splendid Isolation* George Gaylord Simpson, 1996      **Splendid Isolation** George Gaylord Simpson, 1983-07      **History of Terrestrial Mammals in South America** Thomas Defler, 2018-12-19

This book takes a non technical approach in covering the evolution of South American mammalian fauna throughout geological history and discusses how South America has changed due to mammalian invasions. Unlike other works on the subject this book attempts to answer several crucial questions that often go unmentioned together in one cohesive monograph. What was the fauna like before the American interchange? What were the origins of the now extinct groups when northern species arrived and out competed them? How did the modern mammalian fauna come into being with such disparate animal groups? This information is given from a historical perspective throughout the book's 15 chapters and is presented in an easily graspable fashion by mostly avoiding technical language. The book is written for academics, scientists and scholars engaged in paleontology, zoology and evolutionary biology but may also appeal to a larger audience of general readers interested in mammalian evolution. The book begins with an introduction describing the tools necessary to interpret the evolutionary history of South American mammals in geological terms and some of the early people who helped found South American mammalian paleontology. Chapter 2 describes the Mesozoic first mammals of Gondwana and what we are learning about them dominant before the K-T extinction event. Then chapters 3 through 8 cover the Cenozoic or Age of Mammals highlighting the major mammalian groups of South America that replaced the earlier mammals of Gondwana. These groups include the marsupials, native ungulates, the xenarthrans, armadillos, anteaters, sloths, the caviomorphs, rodents and the platyrrhine monkeys. Chapters 9 and 10 address the Antarctic La Meseta fossils and the Colombian La Venta fossil faunal assemblages. Chapter 11 discusses the neotropical mammals that invaded the Caribbean Islands and illustrates the influence South America has had on adjacent faunas. Chapter 12 describes the origin of the Amazon River and the role it has played in the evolution of the mammals and other flora and fauna. Chapter 13 tells the story of the Great American Biotic Interchange (GABI) and chapter 14 follows this up with a discussion of the Pleistocene mammal communities and their eventual extinction. Chapter 15 concludes the text by discussing the modern mammals of South America and how despite the extensive Pleistocene extinctions there is still a lot of mammalian diversity in South America.

*History of Cenozoic Mammals from South America* Federico Agnolin, 2024-04-23

The Cenozoic history of South America faunas mainly rests on the evidence yielded by the study of fossil mammals. Following the seminal work of William D. Matthew, George G. Simpson established the slogan 'Splendid Isolation' for describing the evolutionary history of South American faunas. He envisaged South America as well as other Southern Hemisphere landmasses as dead ends in the evolution and geographical expansion of animals and plants that since the Mesozoic come in successive migratory waves from the North. More than 40 years passed away from the last important contribution by Simpson (1980). Since then, in spite of the exponential increase in biological, paleontological and geological knowledge and an incredibly new number of fossils, his

scheme remained almost unpolluted and most recent books regarding the palaeobiogeography of South American vertebrates follow this paradigm nearly without criticism. However, the fact that South America was joined to Africa, Australia, Antarctica and India during most of the Cretaceous and that it was still connected to Australia via Antarctica and probably Africa up to the Paleogene together with the large number of shared biotic components between these landmasses point in favor of a different paleobiogeographical scenario. The book aims to demonstrate that during the Paleogene and most of the Neogene the nature and evolutionary history of South American vertebrates is by far much more intricate than previously envisaged. As will be shown, new evidence suggests that southern landmasses may have played an important role in the early evolution and radiation of extant mammal clades. This book is not written to conform with the ideal of a technical manual or a review and is not carried forward to collect all that has been said before. The main goals are to criticize the current

Palaeobiogeographic Model of Vertebrate Settlement of South America and to propose a new vision based on the evidence provided by the natural world in the last decades. [A Brief History of South American Metatherians](#) Francisco Goin, Michael

Woodburne, Ana Natalia Zimicz, Gabriel M. Martin, Laura Chornogubsky, 2015-10-16 This book summarizes major aspects of the evolution of South American metatherians including their epistemologic, phylogenetic, biogeographic, faunal, tectonic, paleoclimatic and metabolic contexts. A brief overview of the evolution of each major South American lineage: Ameridelphia, Sparassodonta, Didelphimorphia, Paucituberculata, Microbiotheria and Polydolopimorphia is provided. It is argued that due to physiological constraints, metatherian evolution closely followed the conditions imposed by global temperatures. In general terms, during the Paleocene and the early Eocene, multiple radiations of metatherian lineages occurred with many adaptive types exploiting insectivorous, frugivorous and omnivorous adaptive zones. In turn, a mixture of generalized and specialized types, the latter mainly exploiting carnivorous and granivorous folivorous adaptive zones, characterized the second half of the Cenozoic. In both periods, climate was the critical driver of their radiation and turnovers. **Evolution of South American**

**Mammalian Predators During the Cenozoic: Paleobiogeographic and Paleoenvironmental Contingencies** Francisco J. Prevosti, Analía M. Forasiepi, 2018-01-02 This book summarizes the evolution of carnivorous mammals in the Cenozoic of South America. It presents paleontological information on the two main mammalian carnivorous groups in South America: Metatheria and Eutheria. The topics include the origin, systematics, phylogeny, paleoecology and evolution of the Sparassodonta and Carnivora. The book is based on a wide variety of published sources from the last few decades.

*Mesozoic Mammals from South America and Their Forerunners* Guillermo W. Rougier, Agustín G. Martinelli, Analía M. Forasiepi, 2021-02-22 This book summarizes the most relevant published paleontological information supplemented by our own original work on the record of Mesozoic mammals, evolution, their close ancestors and their immediate descendants. Mammals evolved in a systematically diverse world amidst a dynamic geography that is at the root of the 6 500 species living today. Fossils of Mesozoic mammals, while rare and often incomplete, are key to understanding how mammals have evolved.

over more than 200 million years Mesozoic mammals and their close relatives occur in a few dozen localities from Argentina Brazil Chile Bolivia and Peru spanning from the Mid Triassic to the Late Cretaceous with some lineages surviving the cataclysmic end of the Cretaceous period into the Cenozoic of Argentina There are roughly 25 recognized mammalian species distributed in several distinctive lineages including australosphenidans multituberculates gondwanatherians eutriconodonts amphilestids and dryolestoids among others With its focus on diversity systematics phylogeny and their impact on the evolution of mammals there is no similar book currently available Encyclopedia of Deserts Michael A. **Biogeography and Plate Tectonics** J.C. Briggs, 1987-08-01 One needs to look at only a small portion of the enormous literature on plate tectonics published in the last 15 years to realize that there are many differences between the various reconstructions that have been presented It becomes obvious that although there is a general agreement about the presence of an assembly of continents a Pangaea in the early Mesozoic there is considerable disagreement among earth scientists as to the configuration of the assembly and the manner and timing of the subsequent dispersal While the revolution in geophysics was taking place systematic work in paleontology and neontology was being carried out This book is an attempt to incorporate the biological evidence into the theory of plate tectonics The author traces the changing relationships among the various biogeographic regions and demonstrates how such changes may often be correlated with the gradual geographic alteration of the earth s surface He analyses recent information about the distribution of widespread groups of terrestrial and freshwater vertebrates invertebrates and plants and discusses the biogeographical effects of the movement of oceanic plates

It is particularly important to obtain dependable information about certain critical times in the history of continental relationships. We need to know when the terrestrial parts of the earth were broken apart and when they were joined together. The present investigation makes it clear that we cannot depend entirely on evidence from plate tectonics nor will purely biological evidence suffice. This book thus provides much of interest to systematists working on contemporary groups of plants and animals, paleontologists, evolutionary biologists, and professors teaching courses in biogeography. Evolutionary Biogeography Juan Morrone, 2009. Rather than favoring only one approach, Juan J. Morrone proposes a comprehensive treatment of the developments and theories of evolutionary biogeography. Evolutionary biogeography uses distributional, phylogenetic, molecular, and fossil data to assess the historical changes that have produced current biotic patterns. Panbiogeography, parsimony analysis of endemism, cladistic biogeography, and phylogeography are the four recent and most common approaches. Many conceive of these methods as representing different schools, but Morrone shows how each addresses different questions in the various steps of an evolutionary biogeographical analysis. Panbiogeography and parsimony analysis of endemism are useful for identifying biotic components or areas of endemism. Cladistic biogeography uses phylogenetic data to determine the relationships between these biotic components. Further information on fossils, phylogeographic patterns, and molecular clocks can be incorporated to identify different cenocrons. Finally, available geological knowledge can help construct a geobiotic scenario that may explain how analyzed areas were put into contact and how the biotic components and cenocrons inhabiting them evolved. Morrone compares these methods and employs case studies to make it clear which is best for the question at hand. Set problems, discussion sections, and glossaries further enhance classroom use. Written by specialists in various fields of rodentology and to suggest future lines of research. It is also felt that this work on rodent pest management will trigger more research effort for the benefit of mankind and help certain countries and organizations in revitalizing serious work in this field which it appears has dampened during the last few years. Civilizations development and species origin technologies Вадим Корпачев, 2020-08-13. The origin of life on Earth is the basic view of the world's concept. At present, its origin and development are treated either from the scientific evolutionary theory points of view or religious mythological ones. At the same time, the evolutionary theory fails to provide grounded explanations to a lot of events which have happened and are observed in nature. The data related to the complexity of life processes, genetic programming, and many biology and palaeontological facts cast doubt on the possibility of spontaneous occurrence of protein organisms during evolutionary transformations. They indicate that the protein life development occurred in the direction of the planned improvement through the complex technology's implementation which requires specific scientific knowledge. Therefore, the necessity to formulate the new technological concept of the life appearance on Earth, which is provided by the given book, has

occurred It summarizes numerous well known facts which are being interpreted as the result of the highly developed civilization technological developments The stated views have more grounds for existence than the evolutionary theory and biblical ideas about the divine creation of the world The fact that society treats all the ideas of the life creation as religious ones and that they are used by the theologians turns out to be the ideological problem The book is aimed at overcoming the barrier of such non perception The analysis performed allows the reader to understand in which cases random events occur and in which ones there is a logical purposeful intelligent activity the result of which is the development of self replicating protein organisms programmed to perform the work necessary to meet the needs of their creators on Earth Reflections on the possible material nature of the highly developed mind carriers are given According to the author a human being is not a passive observer of random evolutionary changes in nature but has his mission in the artificially developed system of energy supply of Earth along with other protein organisms If the protein world including humans has been created for a specific purpose then mankind must not violate its implementation and should follow its mission A new worldview should introduce changes in the main mankind s activity spheres science politics religion and the human being s personal life The book is designed for a wide range of readers of various specialties Conceptually it is important for people who do not share the evolutionary theory provisions and existing religious beliefs
