Ralph Highnam,Michael Brady,1999 The key contribution of the approach to x ray mammographic image analysis developed in this monograph is a representation of the non fatty compressed breast tissue that we show can be derived from a single mammogram The importance of the representation called hint is that it removes all those changes in the image that are due only to the particular imaging conditions for example the film speed or exposure time leaving just the non fatty interesting tissue Normalising images in this way enables them to be enhanced and matched and regions in them to be classified more reliably because unnecessary distracting variations have been eliminated Part I of the monograph develops a model based approach to x ray mammography Part II shows how it can be put to work successfully on a range of clinically important tasks while Part III develops a model and exploits it for contrast enhanced MRI mammography The final chapter points the way forward in a number of promising areas of research *From Photon to Pixel*
