Foundations of Sensory Science H. Autrum,L.M. Beidler,H. Davis,H. Engström,G.A. Fry,R. Granit,W.D. Keidel,D.R. Kenshalo,O. Lowenstein,C. Pfaffmann,L.A. Riggs,D. Schneider,T. Tomita,W.D. Wright,J.J. Zwislocki,2012-12-06 When seen from an outsider s vantage point the development of knowledge in the sensory sciences must appear massive and the result of some carefully followed master plan In reality it is the result of numerous relatively independent human endeavors shaped by application of the scientific method The comprehensive construction of quantitative theories of sense organ function has occurred only recently but at an explosive rate prefaced by centuries of expansion in the physical sciences Predicated on this growth the twentieth century may become known as the age of the biological sciences With the exception of a modest number of intellectual giants there were few contributors to the foundations of the sensory sciences before the dawn of this century At least 90% of existing knowledge has been produced by scientists working in laboratories founded since 1920 If any single scientist and his laboratory may be identified with the growth in the sensory sciences it is EDGAR DOUGLAS ADRIAN First Baron of Cambridge and leader of the Physiological Laboratory at Cambridge University England Lord ADRIAN S influence upon the sensory sciences was great not only in terms of his contribution to knowledge itself but also through the influence which he exerted upon numerous young scientists who spent weeks or years at the Cambridge laboratory and who later returned to their homelands and colleagues with the seeds of vigorous research and quantitative inquiry firmly implanted

Studies on the Morphology of the Sensory Regions of the Vestibular Apparatus Henrik Henriksön Lindeman,2013-11-21 The membranous labyrinth lies enclosed in the very hard petrous part of the temporal bone and as the name implies its structure is extremely complex This may explain why our knowledge of this organ and the vestibular sensory regions within it is not yet

satisfactory In recent years the rapid development of space research has provided a powerful stimulus to our interest in the vestibular apparatus This has found expression in annual symposia in which the role of the vestibular organs in the exploration of space is discussed However little is known as yet about the influence upon the equilibratory apparatus during space flight of weightlessness and other related conditions The inner ear has also acquired increased significance from an otosurgical point of view Operations are today performed in regions previously inaccessible to surgery This requires exact knowledge of anatomical details and of relations between the different structures in the inner ear
