**Catalyst Deactivation 1994** G.F. Froment, B. Delmon, 1994-09-08 Catalyst Deactivation 1994 was an expansion of earlier highly successful symposia The

objective of the symposium was to promote a scientific approach of the phenomenon of catalyst deactivation which will contribute to the development of catalysts which are less subject to structural transformations and more resistant to poisons and coke formation. These aspects are dealt with in 12 plenary lectures, 48 oral presentations and 35 poster papers which were critically selected from an impressive response from some 30 countries. Both fundamental and applied aspects were covered. The deactivation of catalysts in important industrial processes like fluid bed catalytic cracking, hydrotreatment, hydrodesulfurization, catalytic reforming, hydrodenitrogenation, steam reforming, hydrodemetallization, hydrocracking, Fischer-Tropsch synthesis, propane dehydrogenation, phthalic anhydride synthesis received considerable attention. Mechanisms of poisoning, sintering and coking were further investigated and modelled and new experimental techniques for the characterization and the quantification of deactivation were also introduced.

*Sintering of Advanced Materials* Zhigang Zak Fang, 2010-09-27

Sintering is a method for manufacturing components from ceramic or metal powders by heating the powder until the particles adhere to form the component required. The resulting products are characterised by an enhanced density and strength and are used in a wide range of industries. Sintering of advanced materials: fundamentals and processes reviews important developments in this technology and its applications. Part one discusses the fundamentals of sintering with chapters on topics such as the thermodynamics of sintering, kinetics and mechanisms of densification, the kinetics of microstructural change and liquid phase sintering. Part two reviews advanced sintering processes including atmospheric sintering, vacuum sintering, microwave sintering, field current assisted sintering and photonic sintering. Finally, Part three covers sintering of

aluminium titanium and their alloys refractory metals ultrahard materials thin films ultrafine and nanosized particles for advanced materials With its distinguished editor and international team of contributors Sintering of advanced materials fundamentals and processes reviews the latest advances in sintering and is a standard reference for researchers and engineers involved in the processing of ceramics powder metallurgy net shape manufacturing and those using advanced materials in such sectors as electronics automotive and aerospace engineering Explores the thermodynamics of sintering including sinter bonding and densification Chapters review a variety of sintering methods including atmosphere vacuum liquid phase and microwave sintering Discusses sintering of a variety of materials featuring refractory metals super hard materials and functionally graded materials
