

физиологические процессы растений (а в конечном итоге на их продуктивность) путем направленного изменения водообмена. Но для реализации такой возможности необходимо изучение водообмена растений в различных условиях произрастания, то есть нужен экологический подход к изучению водообмена. Подобного рода исследования должны обеспечить более глубокое проникновение в сущность явлений водообмена (Петников, 1978).

Результаты исследования различных фракций воды в листьях анализируемых нами растений показали, что наименьшим содержанием общей воды характеризовались листья циннии изящной (неустойчивый вид), а большей оводненностью – устойчивые к неблагоприятным условиям среды виды растений – календула лекарственная, льняной зев (табл. 1).

Наши данные согласуются с данными, полученными В. С. Николаевским (1963, 1964) в экспериментах с различными видами растений. Из данных таблицы 1 видно, что по мере загрязнения среды оводненность тканей исследуемых растений уменьшается, причем наиболее низкой она была у растений в условно среднезагрязненной среде. Известно, что оводненность растений подвержена изменениям как на протяжении вегетационного периода, так и в зависимости от условий местобитания (Молотковский, Рахманина, 1995). Степень оводненности растений является одним из наиболее существенных показателей их водного режима. Она помогает вскрыть пути регулирования водного баланса растений и уяснить механизм их адаптации к условиям среды. По содержанию воды в листьях и ее потерям на испарение можно судить о скорости расхода воды, а следовательно, и активности ее поглощения корневой системой.

Таблица 1

Изменение различных фракций воды у растений, произрастающих в разных условиях городской среды (%)

Район исследова- ния	Параметры			
	Свободная вода	Связанная вода	Общая вода	оводненность свободная
