those buildings written by masters In contrast most software developers only ever get to know a handful of large programs well usually programs they wrote themselves and never study the great programs of history As a result they repeat one another's mistakes rather than building on one another's successes This second volume of *The Architecture of Open Source Applications* aims to change that In it the authors of twenty four open source applications explain how their software is structured and why What are each program's major components How do they interact And what did their builders learn during their development In answering these questions the contributors to this book provide unique insights into how they think

The Architecture of Scientific Software Ronald F. Boisvert, Ping Tak Peter Tang, 2013-04-17 Scientific applications involve very large computations that strain the resources of whatever computers are available Such computations implement sophisticated mathematics require deep scientific knowledge depend on subtle interplay of different approximations and may be subject to instabilities and sensitivity to external input Software able to succeed in this domain invariably embeds significant domain knowledge that should be tapped for future use Unfortunately most existing scientific software is designed in an ad hoc way resulting in monolithic codes understood by only a few developers Software architecture refers to the way software is structured to promote objectives such as reusability maintainability extensibility and feasibility of independent implementation Such issues have become increasingly important in the scientific domain as software gets larger and more complex constructed by teams of people and evolved over decades In the context of scientific computation the challenge facing mathematical software practitioners is to design develop and supply computational components which deliver these objectives when embedded in end user application codes *The Architecture of Scientific Software* addresses emerging methodologies and tools for the rational design of scientific software including component integration frameworks network based computing formal methods of abstraction application programmer interface design and the role of object oriented languages This book comprises the proceedings of the International Federation for Information Processing IFIP Conference on the Architecture of Scientific Software which was held in Ottawa Canada in October 2000 It will prove invaluable reading for developers of scientific software as well as for researchers in computational sciences and engineering

Integrated Computational Life Cycle Engineering for Traction Batteries Felipe Cerdas, 2021-08-30 The environmental burden caused by private transportation represents a significant challenge towards sustainability Electric vehicles are considered a key technology to reduce the environmental impact caused by the mobility sector However the global adoption of electromobility implies shift and diversification of the environmental impacts caused by the transportation sector mainly driven by the production of the battery system Modeling the life cycle environmental impacts of traction batteries is a time demanding and interdisciplinary task as it involves a high variability and requires an in depth knowledge of the product system under analysis To face these challenges an Integrated Computational Life Cycle Engineering ICLCE framework for EVs has been developed The ICLCE framework described aims at supporting fast and comprehensive modelling of complex foreground

Human-Centered Software Engineering - Integrating Usability in the Software Development Lifecycle Ahmed Seffah, Jan Gulliksen, Michel C. Desmarais, 2006-06-26 Human Centered Software Engineering Bridging HCI Usability and Software Engineering From its beginning in the 1980s the field of human computer interaction HCI has been a multidisciplinary arena By this I mean that there has been an explicit recognition that distinct skills and perspectives are required to make the whole effort of designing usable computer systems work well Thus people with backgrounds in Computer Science CS and Software Engineering SE joined with people with backgrounds in various behavioral science disciplines e.g. cognitive and social psychology anthropology in an effort where all perspectives were seen as essential to creating usable systems But while the field of HCI brings individuals with many background disciplines together to discuss a common goal the development of useful usable satisfying systems the form of the collaboration remains unclear Are we striving to coordinate the varied activities in system development or are we seeking a richer collaborative framework In coordination Usability and SE skills can remain quite distinct and while the

activities of each group might be critical to the success of a project we need only insure that critical results are provided at appropriate points in the development cycle Communication by one group to the other during an activity might be seen as only minimally necessary In collaboration there is a sense that each group can learn something about its own methods and processes through a close partnership with the other Communication during the process of gathering information from target users of a system by usability professionals would not be seen as so thing that gets in the way of the essential work of software engineering professionals
