Hockenbury, Sandra E. Hockenbury, 2002-07-19 New edition of the Hockenburys text which draws on their extensive teaching and writing experiences to speak directly to students who are new to psychology *Experience and Possibility* Joseph Mendola, 2021-01-11 Experience and Possibility concerns the modal ontology of experience It investigates the detailed metaphysics of the colors shapes and other concrete properties present in our experience of ordinary concrete objects and also of their spatial and temporal relations It examines their experienced particularity and the nature of their locations and material bits This detailed concern with specific cases reveals many inadequacies of traditional ontology But the central

novelty of the book is an intense focus on the modal aspects of such experienced entities and what it reveals about modality in general. The reality of such things would involve in surprising ways not merely what would hence be actual but also what would be merely possible. This supports a general conception of modality of the possible and the necessary according to which the actual and the possible are locally entwined and involve different types of being. The particulars, properties and relations we experience involve distinctive forms of modal structure characteristic of specific sorts of universals and irreducible particularities. When this experience is not veridical when for instance the color we experience is somewhat misleading about reality it is a puzzle how we have such experience nonetheless. Exploration of these forms of modal structure is groundwork for a new account of how our neurophysiology explains such misleading experience how our physical structure delivers such qualia. This is sketched for the case of experienced color. Its core idea is that the apparent modal structure of things we experience is sometimes due to the actual modal structure of the neurophysiology that constitutes that experience.

Sensory Functions of the Skin of Humans Dan R. Kenshalo, 2012-12-06 This volume represents the Proceedings of the Second International Symposium on Skin Senses held on the campus of Florida State University Tallahassee, Florida. The symposium was held on June 5 through 7, 1978, in honor of Professor Yngve Zotterman to commemorate his 80th birthday and his more than 50 years of energetic involvement in physiological and psychophysical problems of cutaneous gustatory and olfactory sensitivities. The First International Symposium on Skin Senses was intended to stimulate dialogues between electrophysiologists and psychophysicists in order to examine the

mechanisms of cutaneous sensitivity by way of a multi disciplinary approach The 12 years since that meeting has seen much progress in the morphology electrophysiology and taxonomy of cutaneous receptors There has been a growing awareness among psychophysicists that not only are psychometric threshold functions of importance but descriptions of the growth of sensations to suprathreshold stimuli are of at least equal importance One of the most exciting recent events has been the development of a technique that permits recording activity in single primary afferent nerve fibers by poking a microelectrode through the skin into a nerve bundle microneurography This development allows one to conduct psychophysical measurements of sensation and at the same time to sample the primary neural activity associated with the same stimuli The aim of this symposium was to bring together psychophysicists and microneurographers in order to explore the power and the limitations of such an approach when applied to the cutaneous senses
